This is an experience that has been reported by only one individual. No one else has that problem - which suggests that the problem is not what you think.

> My experience is to use the factory antenna, and not use
> longer or roof mount antennas. At least, that in urban

> but they all make the receive go silent.

No one will tell you that this is impossible -- but we will tell you that there is absolutely no technical reason for this to happen and we will also tell you that it does not happen to anyone else.

> One friend of mine who lives out in the wood uses a longer
> antenna to reach the repeater.

A better antenna WILL increase the range of these radios, both on transmit and on receive. As some have noted, a better antenna will also make the radio more sensitive to off-frequency signals -- however I must point out that this effect makes listening to the radio less pleasant but it does NOT generally impede reception of on-frequency signals. This is because any receivable on-frequency signal will generally capture the receiver when the on-frequency signal is present. The difficulty is that in the absence of an on-frequency signal, rather than silence you would expect, the presence of a strong off-frequency signal will cause a burst of static noise from the

receiver which can be very annoying.

Hi Chris,
I have a very strong suspicion that your mobile antenna system is either open or shorted.
 Have you used an antenna analyzer to see what it looks like on the appropriate
frequencies?
If not I encourage you to contact some of your local amateur radio operators to get them to
check out your system. Dave J AF0DJ "When you help someone up a hill, you're that much

The fellow who taught my radio class checked my equipment (handi talkie
and antenna) with his meter, and finds it to be okay.

I bought more than one mobile antenna, and both gave the same symptoms.

Hi Chris:

It is entirely possible that by using an outdoor roof mounted antenna, the UV-5R is being overloaded with a signal from some other service, and so much so that the radio is unable to receive -any- signals. The effect is usually called front end overload, and with FM receivers (which is what the UV-5R has) the overload makes it impossible to detect any other signals.

The “offending” signal could be a Broadcast signal (AM, FM or TV) or some other commercial service that uses high power and continuous transmission. It would probably require specialized equipment (i.e. expensive) to determine exactly what the source of your problem is. Not a convenient answer, I understand. If you have a friend who also has a UV-5R, it would be interesting to see if his using also “goes silent” with the roof antenna.

Steve,

These are fairly good instructions. They make no mention of a very important step, though. The channel that you are programming must be empty when you start. If it isn't these instructions will fail. I would either say this or add a step to make user it is done.

The other thing I would suggest would be to instead of having the user used the arrow keys to find their newly programmed channel, you should show them that they can "jump" directly to it by entering its 3 digit channel number: [0][0][1] for channel 1

That front end overload is what others have written on this list, over
the last few weeks. Sadly, that makes you not unique. I do appreciate
your kindness in any case.

Yes, Chris, we all understand.... YOU SAY that YOUR radio is completely deaf with any antenna other than the OEM rubber duck. No one else anywhere seems to have that problem and there simply is no technical explanation for any condition that could cause this phenomenon. Have you considered attaching the other antenna to the antenna connector on the radio - preferably with a working length of coax cable and a matching connector.

-----Original Message-----
From: Christopher Young cayoung@... [baofeng_uv5r]

My experience is to use the factory antenna, and not use longer or roof mount antennas. At least, that in urban areas and factory parking lots. I've got several antennas, but they all make the receive go silent.

We discussed this weeks ago. Others have the same
problem, and I just smile and live with it.

You think maybe if someone else connects a thread
on connector, that things will be different? If I had
enough intelligence, I'd be insulted.

Hi Phil. If you are in Merced then the factory duckie may have some difficulty reaching the Mt Bullion repeater. I am just a few dozen miles north of you but have the almost identical range and geography to our club's UHF/VHF repeater. I also know the lay of the land down there a bit. My family originated from Hornitos if you know where that little speck of dust is.

I did find that an inexpensive upgraded antenna helped a lot. A good place to start is the Baofeng A-V85 antenna which is what comes stock on the UV-82 models and improves distant performance quite a bit for $6.

Below your original message you will find extensive discussion on the other weakness of the Baofeng rigs, good sensitivity and poor selectivity. I too have an FT60R and find that (poor selectivity) to be the main performance difference between them. The stock antenna on the FT60 is garbage too if you want some distance as you know.

But the FT60 is practically indescribable Love that little brick.

Best of luck This group is a wealth of knowledge. We have contributors from both the miklor.com and Chirp web sites, so everything you could ever want to know is here.

---In baofeng_uv5r@yahoogroups.com, <ko6bb1@...> wrote :

Hi,
I'm "Phil, KO6BB" and I'm new to this list, but NOT to radio as I've
been 'radioactive' one way or another since around 1953.

I'm not 'into' repeaters all that much, my interests lie more in the
Longwave beacon area and HF in general. But I have had more than a few
VHF/UHF rigs, both HTs and mobiles.

My favorite HT by far is the Yaesu FT-60 (I LOVE Yaesu radio's ease of
programming). I've had a couple FT-60s and swapped my last one for an
HF receiver a couple years back. Still have that receiver, but I always
wanted another FT-60 for when I go for my morning walks. Alas, they're
rather dear in price for a retired old phart. . .

I've been eyeing the Baofeng radios for a few months, though the ones
I've heard on the air through our local repeater (on the Yaesu Base
statgion) seem to vary widely in their audio from pretty good to
downright lousy! It seems like it's a crap-shoot if you get a good one
(don't take me wrong, they're at a good price point).

Today I was up on Amazon to purchase a couple electronics items, a
digital LCR meter for measuring coils I wind for Homebrewed radio
projects (I have built radios since I was 10, about 1953) and also
needed a couple other small items.

When an Amazon ad for the Baofeng UV5R (yeah, I know, not their top line model) popped up selling it for $25.88 I decided to jump on it. I also bought their little speaker/mic for $5.82 and the USB cable/programming software for another $5.40. All in all the total is only just over $37.00, AND FREE SHIPPING! How can I beat that???

I'm hoping that the unit will hit my local repeater just fine without having to buy a better antenna. The W6BXN repeater on Mt Bullion is pretty easy to hit from here, and we have a remote receiver right here in town. That's the Turlock ARC repeater and it has remote receivers all over the place, even in Yosemite National park. Anyway, like I said, hope the factory duck will work OK as I went over what we budgeted for "my toys" today (budget is pretty tight). . .

As to programming the critter. I've been reading about those FTDI chips. I'm sure that the cable I ordered probably has a fake one :(This machine is running 64 bit Windows 10, my emergency Acer backup-laptop (very rarely used) still has 32 bit Windows 7 on it, it came with Vista. The wife's 'puter is the same Acer model and still runs Vista (I bought two of those Acer Laptops a number of years ago when they were on a clearance sale).

So I 'should' be able to get one of the three machines to work on the Programming cable. . .

Thank you,
Sort of thought W6BXN/R might be a bit marginal. When I'd take my FT-60 on walks around the mobile home park there were only a couple spots between trailers where it'd drop some (that with the stock duck), but I'd put a really nice, extremely flexible dual band whip on it (19"?) and that cured all dropouts in the local area. That antenna went with the FT-60 when I swapped it. But it doesn't make any sense (well not much anyway) to get a 20.00 antenna for a 25 dollar radio, so if I need something I'll look into that A-V85 one.

Think I've been through Hornitos a few times, but it's been a long time ago.

Personally I think the FT-60 is one of the best dual band HT's ever produced, just couldn't afford another one. And it's so easy to program by hand, once you do one channel the additional channels are second nature. On the other hand, the WORST radio to program I ever had was an older Alinco 2M mobile. I HAD to have the manual in front of me and go down the page step by step for EVERY channel. . .

Well Hello Mike,
It's been awhile since I've been able to hear you on the West Coast Swap Net. Shoot, The past few weeks when Chris is net control about all I've heard is band noise and an occasional check-in. . .

Yeah, I figured that Grady or one of the others I see at Saturday Morning coffee would probably be able to help me with it, though I hate to tell them that I broke down and bought a Chi-Com radio, LOL. Dick, K6SUU loves them (or anything else he can get cheap). . .

And yes, I'll check out both the factory software (I bought that option) along with Chirp and see which I like best.

Not much if you are going from Scali to Vegas on the I15 N

Most of the police/fire med stuff is 800 mhz trunked for SB county and Clark county uses a new encrypted system.

Most of the repeaters from Barstow to Vegas are far and few between with no real traffic until you hit Vegas.

Since most of the CA stuff has gone digital or outside the normal frequencies of any Baofeng, I would suggest SiriusFM satellite radio, some iPod/iPhone music downloads, or some recorded audio books.

A trip to the Live Music Archive (LMA) to fill
your music player first is always a good idea.

Well, "if" you have an amateur radio license, you "could" always program in
some of the repeaters along your route and chat with folks during the drive.

That reminds me of something. When I told my wife I'd ordered an HT and it was only $25.88 (not including speaker mic and software) she asked why I didn't order her one so she could keep in touch without using cell phone minutes. I told her if she got her ticket I'd get her one. Been married 43 years and I've never been able to get her to get a license :(

73 de Phil, KO6BB
http://www.qsl.net/ko6bb/ (Web Page)

PRESENT RADIOS:
Grundigs: S-350 (~2006), G6 (2011) & S450DLX (2014).
HOMEBREW: 7 Tube+Rect Regenerative RX for LF (built 2015)
Icom: R-75 With Cascaded 250 & 125Hz CW Filters. (~2005)
Icom: IC-7200 Transceiver (~2015).
Radio Shack: DX-380 digital portable (~1990).
Zenith: Royal-7000 Transoceanic Portable (~1968).

ACCESSORIES: HOMEBREW LF-MF Pre-Amp, MFJ-993B HF Auto-Tuner.
HOMEBREW 8 Hz Audio Filter.

ANTENNAS: 88 foot Long Ladder-line fed dipole at 35 feet AGL for MW/SW.
HOMEBREW Active Mini-Whip at 36 Feet AGL for LF/MW/SW.
HOMEBREW 37 foot "Low Noise Vertical" at 11 feet AGL for LF/MW/SW.

Merced, Central California, 37, 18, 37N 120, 30, 6W CM97rh

At $25.88 chances are excellent it won't be FCC Part 90 approved, but for some that doesn't matter. Back to the original topic (sort of), if I had to drive to Vegas I finally found a van that wouldn't take away man points, now if I could just get Toyota to actually build these:

Not much if you are going from Scali to Vegas on the I15 N

Most of the police/fire med stuff is 800 mhz trunked for SB county and Clark county uses a new encrypted system.

Most of the repeaters from Barstow to Vegas are far and few between with no real traffic until you hit Vegas.

At $25.88 chances are excellent it won't be FCC Part 90 approved, but for some that doesn't matter. Back to the original topic (sort of), if I had to drive to Vegas I finally found a van that wouldn't take away man points, now if I could just get Toyota to actually build these:

Well, 25.88 is what the Baofeng UV-5R is selling for, brand new (mine should be here late next week, coming from NC). It came to $37 with the speaker-mic, programming cable and software, free shipping from Amazon.

Vegas, sheesh. I haven't been through that town in over 25 years. . .

Yes it will not be Part 90 stickered as they charge more for this version.

For $37 getting all the extras means someone really wanted to dump it fast. Most likely, all comes up below dealer costs. It could have been a return. Chinese companies eat the return shipping so would rather sell at a discount tossing in some goodies than pay the return shipping per Amazon contract.

Of course if there is not anything wrong with it it was a good deal for you.

Rich,

I don't think Phil understands that their two different versions of the base UV-5R radio. Hopefully his works just fine, if not, he can always return it and the cycle will repeat again for the next buyer.

Now as far as the trailer vs. the van, if Toyota actually began production of the van pictured, I'd have to seriously think about it, especially if I could play the "A Team" soundtrack while pulling into a show venue.

BTW, I got another one to add to your buyer book collection stories:

A fellow calls up yesterday complaining about how he's tried three times to get his UV-5RC programmed with his new RT Systems software/cable kit and it won't work. He's really mad and frustrated on the phone, so I offer to help. He starts the install process (for the fourth time) and tells me over the phone that he's got to remove his battery (again) from the radio so he can enter the serial number (from the radio) the RT Systems software is prompting him for (to finish the software install).

I explain that's NOT the right serial number and that the software serial number needed is on the same CD package he had to open (to get the CD out to start the software installation in the first place). There's even a nice *BIG* label on the CD package that explains the sequence needed. After a few seconds of silence, he responds with "oh" and the call ends.....

I have to assume his fourth installation try was finally successful.

Last I checked, truckers might be on CB channel 19, which
is not in the Baofeng radios. Both the freq is unavailable,
and CB is AM or sideband, while the BF radios are FM.

Highway patrol is a maybe, if you can find the freq, and if
that freq is FM, not the new systems.

You might be able to find a list of repeaters along the way,
and talk with other amateur radio operators. That could be
interesting, and interactive. Not just listening.

Hi All,
Changed the thread name .
No, I wasn't aware there were different versions. Hopefully it'll be just fine. It's my first experience with "off brand" HT's as I've always bought Yaesu HT's. I LOVE the FT-60 but swapped my last one for a receiver a couple years ago, and their priced out of my reach at the present time.

That call goes in the book of radio dummies hopefully he is not an Extra Class Ham

We have them show up here with a disk and their laptop to get free computer service. I should get a Geek Squad T shirt to wear around.

Some people that show up at the table I cringe before they even say anything because I know exactly how the conversation will go.

I had maybe 6 calls yesterday for bad radio help and other issues, none of them had issues with radios we sold/sell but with the $30 Amazon specials. Seems the stuck jack issue has returned in some of the recent batches.

Also the new UV82 ANYSEC 8W HP came in, they look nice I will give your Email to the sales rep to contact you about getting them.

SB county CHP is on a trunked system for SB County which changes over to NHP at the border. The only freq that the uv5R series can pickup is the car to car VHF link

A 30-50 mhz 6meter area extender is used at those desert areas. Most of it is County systems Smartnet II

Let's see, Mr. Guernsey (KZ8O, an Extra no less) acknowledges that he received a prior warning from the Commission regarding causing interference to other amateur radio operators, and admits that he may have caused interference to ongoing amateur communications. According to the FCC, Mr. Guernsey has a long history of causing interference to other amateur radio operators and has been warned repeatedly (in writing) by the Bureau that his actions violate the Communications Act and Rules.

I'm trying to see why we are supposed to feel sorry for this guy? I'm sure some of the money can be raised by selling his station equipment on E-Bay. Besides, the FCC has already stated that he can request payments via an installment plan.

I never intended to imply that i feel sorry for him.. would be ok with me if the fine had been 10x that amount. if you can hear the crowd near 3.843 on the east coast usa after midnight local, you probably would wonder why there are not at least five more in the same situation.

I posted this because i have heard this crowd several times and they belong in prison, not just a fine.

THis might sound a bit off beam, why not make a youtube recording of what happens on the radio. SUre, its video (and you can show the face of the radio). The more publicity you can generate, the more likely it is that the FCC will have to pay attention. BTW, VHF can certainly reach across borders. I routinely talk 2 meter SSB from phoenix to LA using only 25 watts and a 15 element beam. I have also worked hawaii from here on tropospheric ducting. THat one is rare, but doable. THere is also the International SPace Station. So yeah, the argument that VHF doesn't go that far falls about as flat as one of the patriots footballs. And yes, if the jammers get some real jail time, it will show there is a price for their idiocy.

I need to do that when "Gomer Goodbuddy" in my area is on. He's not really one to go on for any length of time though. Kerchunks, farts, quick comments.

Complaining about someone is only part of the effort. I've seen several successful efforts to catch people, but it takes a concerted, coordinated, effort by the amateur community. Basically do all the ground work, hand the FCC an open and shut case with audio recordings, video, dates, times, direction finding results, anything and everything you can put together. They will take that and run with it. But if you just complain with no further information, they are not going to pursue it.

well,
there is a relatively easy way to track down some of these people. I have a receive only magnetic loop mounted upstairs on the roof. With it, I can get a very accurate bearing on the noise source. All I need is 2 others at other locations and I would be able to triangulate the offending signal down to a square block or so.

One thing I know about these idiot jammers: they will eventually make a mistake and get caught. They are not all that smart.

true enough. I have found that really the only way to get the local ham community organized and doing this is if it involves some enlightened self interest. If you look at a posting called FCC V. Timothy Harold Hoffman, you will see how long it took me. There had to be a change in the Arizona repeater Association leadership before things got done. Once that happened, it didn't take too long. btw, I was the victim in that case (as it was my call being used to interfere with various machines here and also used to make false 911 calls on the local auto patches).

Topic: 52018 Message: 52253

I'm getting closer. I am no longer having the issue with the TX getting stuck. The TNC-X pegs the radio as it should with no issues. The trouble now is I get no response back from the other station. RMS Express will transmit about 3-4 times, the red light on the TNC and the TX light on my UV5R illuminate during the transmit. I get nothing back. I've tried all squelch settings 0-9. I have STE off. Not sure what to do next.

I have tried a Kenwood D72 ($450.00 radio) and got the same results until I put the radio on a gain antenna. Even indoors downstairs works fine on an Arrow dual band jpole. 4 watts just not enough to reach your next digi.

Hi,
I don't want to sound like an idiot if/when I discuss the Baofeng radio
and accessories on the local repeater or to another ham.

I know that Chinese words often don't sound like they look in English.
Could somebody please post a "Phonetic" spelling of Baofeng?

Mine should be here this coming Saturday, though the last Amazon Fedex
shipment scheduled for a Saturday here arrived two days early. . .

Like most, I've heard it several different ways (some of the most interesting also have a southern slang), but most folks I know say "Bow" (like the bow of a ship) "Fung" (like fungus), but I've also heard folks pronounce "Bow" (like what Western Indians used). Speaking of bows, check out this neat picture of the bow of the QM2 and her skipper (near the bottom of the picture).

[image: However, the idea was clearly inspired as the pictures look astonishing.]

I heard somewhere it is pronounced Pofung, and that was the reason for the name change.

The folks around here say BOW - feng

The first part is bow, like "I am Chinese, not Japanese. I do not bow when I greet other people."

Second part, feng is a bit like the center part of the word "offended". But with a g on the end.

The dog says bow wow. The woman was offended by the drunk. The folks here say BOW-feng. Hope that helps?

Amazing isn't it how "nature" has a way of being the great equalizer and balancing things out in the long run...

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote :

It normally takes more than one individual in any club (including the ARA) to finally get serious about jammers. Once they do, however, it's normally not too difficult to track down the individual in short order. Actually getting them to stop their jamming, however, can sometimes take some additional convincing.

Heard a story some years back about a ham back east that had been warned many times about jamming the local repeater, but he made the mistake of going on vacation for several weeks. You may know the type. First they jam the local repeater and then play Kilowatt Ken on 11 meter CB (trashing local TV reception for blocks around him).

He came back to find his basement ham shack flooded (without any apparent leaks in pipes). Of course, the summer storm also played havoc on his tower and antennas, as two of his three guy wires somehow worked their way loose in the high winds and the whole thing came crashing down in his back yard, including his large CB antenna. Thank goodness the tower and antennas fell in the only direction that didn't damage the property of anyone else. Very lucky indeed.

Funny thing was, the entire time he was gone (and even for months after he returned home from his vacation), the jamming stopped. Odd how sometimes mother nature steps in to help restore the balance. As the story goes, it wasn't long after that storm that he moved and wasn't heard from again (at least on the local frequencies).

For lack of a better term, that tone could be the RMS Gateway's "beacon", KJ4AJP-10 sends one out occasionally, I'm not sure if it's the RMS Gateway software or something in the KPC-3, so it may not be common to all Gateways or the RMS in your area. The beacon transmission stops the scan on the radios I have the freq programmed into that have TNCs or soundcard interfaces attached so the radio can do digital as well as voice (my TH-D72 for example). I've never timed it but I assumed it was around the time the icon would update on APRS-IS maps (around every 25-30 minutes or so).

Judging from aprs.fi and the last known position of your internet-only UI-View PC, I'd seriously suggest you set this thing up using APRS rather than Winlink, you have an APRS digi about as close as the nearest Winlink RMS anyway. There's probably constant traffic to monitor on 144.390 so you get immediate feedback on what's going on, otherwise you'd need two complete Winlink setups (aka, a friend to monitor using Winlink P2P).

The TNC-X set-up instructions can be a little vague to first-time users, if you need an interpreter, my call at arrl dot net will get us emailing simplex. Otherwise:

#1.) Have you hooked the radio (tuned to 144.390) and TNC-X to a PC running a terminal program, seen the yellow light flash on the TNC-X when a packet was received, plus seen any human-readable text amidst all the alphabet soup using the terminal program?

#2.) Have you set the deviation by ear on the TNC-X while monitoring the tone with a different radio/scanner?

Years ago, I read in a novel where a phone operator from
the south had to make a long distance connection to the
north. Neither would admit the other was speaking American.

I was raised in NYS, about six hours drive west of Lawn
Guyland (Long Island). Some of the folks from NYC have
totally different accent than NYS.

Perhaps it less matters how we pronounce PingFang?

For reasons that elude me, you can travel from one end of Oz to the other and the accent is no different. The only very subtle differences are some names for various things.

For instance, a suitcase. In Austrlalia, it's, well, a suitcase. In one or more of the Eastern States it's a 'port' apparently an abbreviated version of 'portmanteau' which means, uh, well, suitcase.

What you wear to go swimming:
SA 'Bathers'
NSW 'Togs'
Vic 'Swimmers'

Queenslanders have a slight tendency to end sentences with 'ay'. 'Great day ay?'

A few other subtle things, but just on accent, anywhere from Kakadu to Katoomba is pretty much the same.

We probably haven't been here long enough.

Geoff in Oz

To pronounce it 100% correctly you need the 4 tones too

So Bow Fung would have 4 tonals for each . I cannot remember but I think it is Bow 1st and fung is low to high.

Funny thing was, the entire time he was gone (and even for months after he returned home from his vacation), the jamming stopped. Odd how sometimes mother nature steps in to help restore the balance. As the story goes, it wasn't long after that storm that he moved and wasn't heard from again (at least on the local frequencies).

What's even more effective (if the individual uses patch cables) is to remove the center pin entirely from an adapter and replace his adapter with the modified one, but that's much more difficult (unless the cheapskate is using multiple patch cables for his run of coax outside his place).

Of course it's always nice to have friends that majored in Chemistry as well, it's amazing what mixtures they can come up with that affect all kinds of things (especially if you don't mind waiting a little while for a good storm to blow in).

And how many can use TDR to find the pin? Of course he has to not notice
the reduction in everybody's signal strength on receive. Then there's the
one transistor regen receiver in a zip bag hanging from a nearby tree.
Can't work 'em if you can't hear 'em.

It might be well to mention that THAT kind of "stepping up to the plate" is a felony which will ALSO cost the ham (and any other) license of anyone identified as involved. The full text of the law is much to lengthy to include here, but the relevant pieces are:

47 U.S.C. § 303 - Powers and duties of Commission
...
(1) Have authority to suspend the license of any operator upon proof sufficient to satisfy the Commission that the licensee
...
(C) has willfully damaged or permitted radio apparatus or installations to be damaged;

And, yes, the FCC does consider that a serious offense, regardless of any provocation

Yup, it sure was a good thing that mother nature didn't care about 47
U.S.C. § 303 (or at least that's the story I heard).

I think someone did something to his antenna, but maybe not as I heard him on air tonight driving home. Most likely, idle threats and P contest fighting.

Lots of threats going around sometimes on that frequency.

Hi Eric

"why not make a youtube recording of what happens on the radio"

Your wish is my command, and you should check this:

http://www.lidlist.com/

It is pretty hilarious what people hiding behind the anonymity of the radio waves will do. But remember just as you think you are shielded from discovery so you should know that you can be found in any case. Yes it will take some time and effort, but it can be done.

Let that be a lesson to ANYONE who is too dumb to follow the rules wether it be on the air or via email.

Sign your name (or state your call sign) and own it, the Good guys do it and the Bad guys don't and that is how you protect yourself. Now I'll get off my soap box and wish you a

77 that is 73 +4 for interference, Ha Ha Ha

Wassim
WN6WJN

PS: In Amateur Radio lingo a lid refers to a "bad" operator. Bad may also mean inexperienced but that goes away over time. So if after 10 years you are still a Lid, well there is something wrong with you. Just to clarify if anyone was not sure.

This cheap junk is why ham licenses are at an all time high. The good expensive riga are still there, too. Now more people might actually have an interest in forking over hundreds of dollars for one, thanks to Baofeng's entry level product sparking the interest.

"If" that "cheap junk" Baofeng radio was what enabled a Search and Rescue team to find your child lost in a forest, I'll bet you'd think that radio was "priceless".

Most folks wouldn't think of handing a kid (licensed or not) an expensive Japanese radio to take on a Cub Scout weekend, but probably would hand over a Baofeng for that purpose without worrying too much about cost. Really cheap insurance.

i can't admit to dropping a rig from a tower but I DID drop my VX-7 out of an airplane once. Good thing we were on the ramp, eh ?
I HAVE broken the SMA connector on a wouxun by accidentally dropping out of the truck and having it land on the antenna. I was quite glad that it wan't the -7.
Yes, inexpensive radios DO have their place. Anywhere around a klutz like me my wife would say.....grin. Dave J AF0DJ

Actually, Wouxun is much closer to "O-Shing" than Ocean, but that's still way closer than how most pronounce it.

Unlesss you want to cover a really wide area you might reconsider using an upgraded antenna. The -3db gain antenna that comes with the rig should be sufficient for local fox hunting.

From: subscriptions@...
Topic: 52310 Message: 52311

I'm not (yet) licensed, but meanwhile I do enjoy listening in. I've recently purchased a Jeep Wrangler and am mounting a CB antenna. Will the FireStik FL-4 4' fiberglass antenna (with tunable tip) work for HAM as well? I'm thinking 'no', but want to confirm. If the answer is 'no' then (1) is there an antenna that would work for both CB and HAM, or (2) is there any issue with disconnecting the CB antenna and replacing it with a HAM antenna (using the same mount, cabling, etc.) when I want to use HAM?

Thanks in advance,
Andrew

52312. Re: [baofeng_uv5r] CB/HAM Antenna

Try a quick connect. you will need two.

http://www.amazon.com/Accessories-Unlimited-Antenna-Quick-Disconnect/dp/B000WDP21C/ref=sr_1_5?ie=UTF8&qid=1440694865&sr=8-5&keywords=Antenna+Quick+Disconnect

You can get a firestik of your choice and swap out

On occasion I'll go camping in remote areas. I'd love a portable mast that would serve two purposes. (1) Support a HAM antenna. (2) Support a Yagi antenna for my cell/data booster.

Are there any reasonably high (20' or more) portable telescoping masts available on the market that won't kill my budget? If so, any help in locating them would be greatly appreciated.

Thanks in advance,
Andrew

Excellent. Thank you.

It's also a thought to just make two mounts and run two separate cables. I'd put both on the same bracket, so they would only be a few inches apart. Would there be any issue with doing this? Would there be an issue with running the two bands at the same time (both CB and HAM)?

Thanks again,
Andrew

Since the YAGI will let me work during the day while camping, I'm willing to spend $100 or so on something.

The Harbor Freight telescoping flag pole is near perfect. But I'd spend a little more if I could get more height.

Thanks again,
Andrew

Considering CB is a preset set of frequencies and Ham covers such a wide range, it all depends on which ham bands you want to cover. As a previous poster requested, "mo' info, please!"

a 11 meter antenna (CB) can usually be adjusted for 10m Ham. It's not for use with Baofeng's which are 2M and 70cm.

Harbor Freight has a 16 and a 20 footer. Depends on what you mount them on exactly how high you can get, along with what antenna you use. You can take the ball off, get a bolt to go in the hole, take a small piece of sheet metal and mount an NMO antenna or a PL-259 type antenna to it. You may or may not need guy wires.

Jardy Dawson
WA7JRD Ham Radio

Yes, sorry for not being more specific.

This would be for the Baofeng UV5R, so it looks like I'll need two antennas. But it's good to know that I can at least use quick disconnects to swap out the two antennas.

But that does leave me with my other question on if there is a problem with running both the CB and HAM at the same time (from two antennas a few inches apart).

Thanks again,
Andrew

I bought a 23ft painter pole from home depot, about $40. Need a mop handle
thread to 1/2 inch pipe thread adapter, they are about $5 from buddipole.
I then use a fence post from tractor supply, about $5

When doing this I'll usually be stationary for a few days, so rigging guy wires isn't any problem. I'll have to check out the HF pole. If I can take the ball off and rig another extension (or more) to it for additional height then that would be even better. 30' would really do me well for getting access to a cell tower with the Yagi.

Transmitting on the CB will probably obliterate the signal being received
by the Baofeng.

I'd try to separate the antennas as much as possible. I've got a 102" whip with spring and beehive mount on a the passenger side of the back bumper of the Silverado, a Diamond SG-7900 on a Firestik SS-194 on the driver's side rear stake-hole, and a Tram 1180 on a Wilson 311104 clamped to an Accessories Unlimited AUGM2-L on the driver's front. (The stock AM/FM radio antenna has a Para Dynamics PDC63 splitter for the scanner if anyone is wondering what's on the passenger front. <chuckle>)

You'll just have to use your ingenuity for mounting locations on your Jeep. If you're going to use a single mount with quick disconnects, consider the Hustler QD-2. Biggest issue you'll have is that CB's normally use a 3/8-24 mount, where all the dual band 2M/440 antennas like you'll need for the Baofeng that I've seen will be UHF or NMO. So you're probably looking at two separate antennas and coaxes anyway.

Previous to the SG-7900, I had a Hustler CG-144 (2M only, but 3/8-24 mount) on the SS-194 on the driver's rear. To get the SG-7900 to work, I converted the SS-194 to a SS-194A with a K-4A, flipping the UHF end of the mount up so the SG-7900 could mount on it. Since I'm using the Firestik Fire-Ring cables, the stud on the UHF mount needed a thin 3/8-24 plastic insert locknut to get a full grip. Check eBay item 200967774792 for a look at the nut.

Channel Master makes some longer steel masts in the 40 to 50 ft. range which can handle (with proper guying) larger antennas and yagi beam antennas. They are sold on Amazon and WalMart. Jumping from 20 ft. to 30 ft. (or longer) will probably mean leaving thin walled aluminum tubing behind. Of course the size of the antenna load at the top will also greatly determine your selection.

Space Weather News for Aug. 27, 2015
http://spaceweather.com

Earth's polar magnetic field is storming as our planet passes through a region of south-pointing magnetism in the solar wind. Last night (Aug. 26-27), observers around the Arctic Circle saw some of their first auroras in months and Northern Lights descended across the Canadian border into multiple US states. Solar wind conditions favor more geomagnetic storms and high-latitude auroras on Aug. 27-28. Check http://spaceweather.com for more information and updates.

AURORA ALERTS: Don't sleep through the auroras. Get a phone call when geomagnetic storms are underway. Space weather alerts are available from http://spaceweathertext.com (text) and http://spaceweatherphone.com (voice).

You are subscribed to the Space Weather mailing list, a free service of Spaceweather.com: http://spaceweather.com/services/ .

No, you really don't want your CB antenna and your dual-band VHF/UHF antenna to be that close together.

You would want them to be at least a 1/4 wavelength apart or you can have problems. For the amateur antenna assuming dual band you want that antenna at least about 20" (2 meter band) from another vertical surface or antenna. If the CB is the priority then a whole lot more like 10 feet if it is a single stick I believe.

The longer/bigger antennas work better.
I also found the ones on the back bumpertuned higher then they would on a flatarea because the capacitance between theantenna and the body made the antennaelectrically shorter.

I should have given a little more info.... The radio will be controlled by a Byonics PicCon and will feed a quarter wave antenna. I have the complete rig built in an ammunition case that was powered by a radioshack HTX202 which no longer functions. The HTX202 was always used on low power and so will the UV5R. I would rather spend the thirty bucks on the baofeng than spend seventy five on eBay for a used 202. My concern is the duty cycle since it could be on the air for an hour and a half.

On low power, feeding an external well-matched antenna, MOST of these radios will have absolutely no problem with the duty cycle you originally mentioned -- assuming your ammo box isn't in direct sunlight inside a closed car in the middle of summer

I say "most" rather than "all" because the reality of Chinese electronics is that some a faulty units do get shipped, and we do see a LOT of variation between individual radios. The simplest test is to initially try out the radio - with the OEM junk antenna - on full power for a QSO on your local repeater -- if there are any indications of a problem, send it back. If it acts fine, then set it up in your ammo can and give it a try BEFORE the actual foxhunt.

I should have given a little more info.... The radio will be controlled by a Byonics PicCon and will feed a quarter wave antenna. I have the complete rig built in an ammunition case that was powered by a radioshack HTX202 which no longer functions. The HTX202 was always used on low power and so will the UV5R. I would rather spend the thirty bucks on the baofeng than spend seventy five on eBay for a used 202. My concern is the duty cycle since it could be on the air for an hour and a half.

Topic: 52312 Message: 52340

Just so. In the US, IIRC , ‘CB’ is 27Mhz (11m – used to be a ham band in Oz) and the 1m ham band is just above it at 28mhz. You could probably cut a (say) ¼ wave vertical to cover at least part of both bands. However the BaoFeng doesn’t do 10m or 11m so you would need different equipment.

If by ‘CB’ you really mean FRS, that’s a whole different thing and I’ll leave that to the locals, but it’s probably possible to do FRS and 70cm with a singles antenna. That said, legally, that’s not permitted, as I believe type approved FRS radios can’t use anything but the onboard antenna.

Subject: Re: [baofeng_uv5r] CB/HAM Antenna

Considering CB is a preset set of frequencies and Ham covers such a wide range, it all depends on which ham bands you want to cover. As a previous poster requested, "mo' info, please!"

Excellent. Thank you.

It's also a thought to just make two mounts and run two separate cables. I'd put both on the same bracket, so they would only be a few inches apart. Would there be any issue with doing this? Would there be an issue with running the two bands at the same time (both CB and HAM)?

Thanks again,
Andrew

Thanks everyone. I've decided on a kit that mounts to the license plate holder and allows the cable to be fed to the front dash through existing holes. I'll just use a pair of quick-connect adapters to swap antennas and only use one radio at a time.

Thanks again for all the input,
Andrew

I was a Lowe's today and saw the 8' to 23' painter's pole. Then I noted that there was another 2 section 6' to 12' pole that can easily be adapted to screw on to the end of the painter's pole. That would effectively take me to 34' to 35', depending on whether I used my screw-in-ground mount or an under the tire mount. I'll probably add three guy wires for stabilization of the Yagi, but otherwise I should be good to go. That's 35' for under $75 when all is said and done. I can live with that.

I'd thought about using cyclone fence cross bars. It would work, but it would be quite heavy. The solution you all have suggested is much lighter.

Thank you all for pointing me in the right direction,
Andrew

I have to agree with most of what Scott said...

Without the specifics of the vehicle AND any limitations you might insist on, we can't offer any specific advice, but there are some general principles that we can suggest:

As Scott mentioned, you generally want the biggest antenna you can
You also want the antenna as high up as you can
and
on a mobile, you want the antenna mounted as close to the center as you can
so
for a CB radio the ideal antenna is pretty much a 102" stainless steel whip mounted on a 6" spring, through the center of the roof of your vehicle.

Yes, we all realize that very few people are willing to do this (I did accomplish almost exactly that with the whip mounted at the center of the front cross-bar of the roof rack on a Rambler station wagon many years ago).

The one point where I will disagree with Scott is his comment that a 4' firestick is a "really poor" antenna on CB. A real FireStick (not a copy) consists of about 8' of heavy copper wire wound around a fiberglass rod. The inductance of the coiled wire makes up for the fact that the physical wire is slightly less than a full quarter-wave. The six-foot firestick works pretty well, as you move down through the 5' then 4', then 3' firesticks they each work less well, but especially the 4' and longer versions generally do work as well as or better than other mobile antennas of the same overall length (largely because the loading coil of the firestick is at the top of the whip while the loading coil of other mobile antennas is generally at the bottom)

So, what VHF/UHF antenna have you decided on?

As I previously mentioned, I've never found a Baofeng-compatible VHF/UHF dualbander mobile antenna that has the 3/8-24 mount you'll need to utilize quick disconnect adapters. On the other hand, CB antennas are primarily 3/8-24, although Wilson and maybe others do make 11M NMO mount antennas.

If you're going to stick with a single mount and coax and swap between an 11M CB and a 2M/70cm Baofeng, you may want to consider a NMO for your Jeep's mount. A 2M/70cm mobile antenna with NMO mount would screw directly into it. For an 11M antenna like the Firestik, use a NMO to 3/8-24 adapter like the Tram 1295.

In other words, you won't have a "quick disconnect". You'll be unscrewing the antennas from the NMO mount on the Jeep when you want to swap between antennas and radios.

One thing you absolutely need to do is get the antenna high. Attaching in the area of a license plate puts a huge amount of the car metal adjacent to the antenna, which both blocks the signal entirely in that direction, as well as causes a high reflected signal when transmitting. In english, that means you will have both poor reception and poor transmitting range.

The best choice for a mobile antenna is a permanent mount in the center of a metal roof. Few are willing or able to do that, but compromise mounts on fender wells (using an L shaped bracket) on the hood (or trunk of a regular sedan) can produce very good results. Mount the bracket maybe half way between the front of the vehicle and the metal post supporting the side of the windshield to keep the antenna as far away from adjacent metal, and you can expect generally good results.

I think you will be disappointed with any antenna mount that is low.

Wow! There are a lot of details here. Thank you.

For some reason I did miss seeing some posts people made. I think I've seen them all now. But I'm going to need some time to digest all this information, especially accommodating the differing attachments. (I hadn't thought about that being an issue.) Also, the antenna installation(s) are not at the top of my modifications list, plus I'm going to be out-of-pocket and not working on anything for a couple weeks.

I realize top center is the best for placement, but that's not going to happen for daily use. I'm just not that concerned about optimal transmission or reception. However, I could see me installing a separate mount that's attached to my roll bar. When I have my top off and I'm out in the field then I could use that mount instead of the license plate mount. (Or would I then have an issue with tuning?) This is the kit I was planning to get:

That's a 3/8-24 mount. If someone knows of a VHF/UHF antenna with a 3/8-24 mount, I'd love to know because I was looking for one. The Hustler CG-144 or Firestik 2M-4 and 2M15 series have 3/8-24 mounts but they are 2M VHF only, so you'll lose the 400-480 MHz UHF capabilities of your Baofeng.

If you're intent on a single mount and swapping antennas, I'd still suggest a NMO base, a NMO mount antenna for your VHF/UHF, then a 3/8-24 CB antenna on an adapter like a Tram 1295 or Opek NMO-6.

Google " jeep wrangler NMO mount" without quotes for some mounting ideas.

The best VHF/UHF antenna with a 3/8-24 mount is 19" of stainless steel -- although you will usually need to cut down a longer whip to make it yourself.

I actually thought about using one of those on the SS-194 mount, but was already set up with the Firestik FireRing cable in the rear and didn't want to re-run coax. So I went with a SO-239. But I regress...

Since that 905814 has a 3/8-24 "stud" it should fit a 3/8-24 mount, but a 3/8-24 mount actually has a 1/2 hole, so you'll need to keep the insulated shoulder washer in the 1/2" hole to act as a 3/8" reducer.

Check out the Accessories Unlimited PCA3002 mount, it would go behind your spare tire. You would remove the stud that came with it, keep the shoulder washer and insert the 905814 NMO connector. Google "PCTEL Maxrad BMA-NC" (no quotes), and pics from most hits will show a similar NMO disassembled. It should fit through the shoulder washer, just make sure it gets a good ground connection from underneath. Also the 905814 was designed to go through a roof or trunk so the underside where the coax is would have protection from the elements. In your case it would be out in the open so you'd probably need to put some silicone caulk on it so water doesn't short it out.

You'll need to put a connector for the radio on the other end of the coax. Welcome to the radio hobby, prepare to learn to solder. :-)

I'd recommend a PL-259 UHF connector, that's should go directly to your CB. For the Baofeng, check out the WOU-7839-CBL-10, something like that would adapt the Baofeng's SMA-F to the 905814 's PL-259.

Now, take your CB antenna with a 3/8-24 stud mount, screw the Tram or Opek adapter on it. Or take your VHF/UHF antenna with NMO mount. Screw antenna of choice on NMO mount. Check SWR. Tune as necessary. Have fun.

The more I investigate, it looks like it's just going to be both easier and better to have two separate antennas. From what I can read with others that have a Jeep, for the Baofeng I a hood cowl mount seems to be the best (if not mounting on the roof).

If you folks agree then do you have any specific antenna and cabling you would recommend?

Thanks again,
Andrew

Whoa! Thank you Roger. That's really stepping me through it.

But see my previous post (sorry I got my reading out of order again). Would it just be better (and easier) for me to have two separate antennas with the Baofeng going to one on the hood cowl? If so, do you have a setup you would recommend. (And not that I mind soldering, but from what I can see on some Jeep threads, the license plate mount did not do well with transmission.)

About what I got with my 102" with a Hustler SSM-3 spring on a beehive mount on the rear bumper. I took a few inches off, but ended up with a LDG Z100+ autotuner so I could use it on both 10M and 11M.

WARNING for anyone looking at a 102" whip... get a Hustler spring, don't waste your money on a Workman or similar spring. Wayyyy too flexible. Although the whip going almost horizontal and spinning around in a cone behind me did keep other drivers backed off. :-)

 Scott, KB3JQQ wrote:
Each spring adds 3 inches to the length.
My 102" whip tuned to 28.46 with no spring,
and was just about at CB channel 11 with
the spring installed on a ball mount.

****
19" high on a pickup's rear stake-hole mount wouldn't
clear the cab up front. I'd need a few springs to bring
it up higher. ;-)

At the frequencies you'll be operating on, the mount is agnostic (or else you won't find an antenna with that specific mount, hence my inability finding a 440 MHz antenna with a 3/8-24 mount).

The coax will have greater loss at higher frequencies, but at mobile lengths and power it will be negligible. Bigger is better, but trust me, you'll end up with RG-58.

Choose your antennas based on their specifications for the frequencies you plan to operate on.

I didn't buy it for a Baofeng, but I chose the UHF/PO mount Diamond CG-7900 VHF/UHF antenna for two reasons - because it's tall enough to get well over my topper when mounted on the rear stake hole mount, plus it has a wide enough bandwidth to operate outside the Amateur frequencies and into LMR.

You were absolutely right Roger. Sometimes it takes me awhile to fill in the gaps where I just don't know what I just don't know.

As far as the mounting bracket, I've seen several postings with manufacturers and parts. No problem there. But what I haven't seen is what bands they operate on. I (so far) haven't been able to tell if they cover 2m/440 or not. I'll keep looking, but if anyone here has experience with a mobile antenna and cabling for the Baofeng then I sure wouldn't mind being given specifics.

Thanks again,
Andrew

That is a nice antenna! It seems it would suit me very well as I grow into the hobby and end up getting a more capable mobile radio.

It also seems with the way it is built and with its height that it would work mounted on the license plate holder. Or am I mistaken with that understanding and should keep it simple and just stick with a cowl mount regardless of antenna?

If it would work on the LP holder, I'm thinking a max of 18' shouldn't result in too much loss. Or am I mistaken there too (and should stick with the cowl mount and significantly shorter cabling)?

Remember, you have a Jeep and could head out to the boonies, so you want something tough. I had a Comet SSB-14 on my HD Electraglide that vibrated apart in less than a month. I'll repeat - read the Jeep specific recommendations, the folks in those forums will tell you if they gambled and lost.

well, it does depend on the version of OS X you are running there. SOme of the latest OS X updates tend to break the driver for the cable device used to communicate with the radio.

As an aside, I have a problem with chirp in general. I can't use it on a mac or in windows as it doesn't play with my screen reader. To clarify this statement: I am totally blind and cannot use this program AT ALL because its interface is invisible to the screen readers I use. THis basically means that I have to pay money to get a program that does work (RT Systems). I have tried to contact the developers of chirp about this. I got told basically to go pound sand. So, in good conscience, I can't recommend chirp for the blind ham at all.

The program itself sounds like a good idea. There is the issue of the app developers attitude toward the disabled ham. He refuses to turn on any accessibility features in python (which the program is coded in) and refuses to work with any blind ham. I am not the only one to have addressed this on the chirp users mailing list. He did say, however, if I were to donate a substantial sum of money to the project, that he might look into it. I wish I could, but being on a limited income means that I can't spend a lot of cash, so I have to buy cheap. The Bao-Feng radio is just that: cheap. It works well and doesn't cost a mint.

I had issues with what was probably a phony cable. Bought an FTDI “real” cable, ran CHIRP via the Linux Live version, and was able to program my UV-5R. Although I was using a Mac, I booted into Linux via a CD I burned from a download from the Miklor site.

52369. Received my radio and accessories today

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-28 20:36:32 UTC
From: Phil
Topic: 52369 Message: 52369

Hi All,
Today "Mr Postman" delivered my Amazon box with the goodies I ordered. My primary item of interest was the LCR meter I ordered so I could measure small value coils and capacitors. When I placed the order, an ad for the UV5R popped up at a good price and I couldn't resist it as I'd been eying one for awhile. Also got the speaker/mic and "Phony-Baloney" cable and software.

Before doing ANYTHING with the radio I put it on the charger to make sure the battery is topped up before programming.

I DID plug the cable into the computer to check it's compatibility, and of course found out the cable wasn't compatible! NO SURPRISE, I just went through the set-up routine and loaded the proper Prolific driver and the cable is now recognized just fine.

I have a few other irons in the fire at the moment, but maybe I'll check out the actual Baofeng software and/or download chirp later this evening or tomorrow and actually program the radio so I can use it.

By the way, the speaker mic plug fit the radio just fine (I hear some don't) but of course won't actually know if it'll 'talk' until I program some local repeaters into it.

So far it looks VERY nice and I'm impressed, for $25.94 how could I go wrong? Of course it's not a Yaesu FT-60 (my all time favorite dual band HT), but I couldn't afford another one of those right now!

If you want to clear the cab, mount the antenna ON the cab.

You can find some VHF/UHF antennas that are taller than the height of the cab above the bed rail, but the simple fact is that MOST of the antenna will still be lower than the cab.

Mounting any antenna at the "rear stake-hole" of a pickup will result is a very skewed radiation pattern, with most of the radiation going in the general direction of the truck body (effectively towards the cab) but with some reduction by the cab blocking SOME of the radiation.

Any antenna mounted at the corner of any vehicle produces a radiation pattern skewed in the direction of the vehicle body.

At VHF/UHF, you really want to get at least a quarter wavelength IN from any edge of the vehicle. Think seriously about mounting the antenna on the cab roof (mag mount?) or on a raised bracket above the front of the bed.

19" high on a pickup's rear stake-hole mount wouldn't clear the cab up front. I'd need a few springs to bring it up higher. ;-)

Before you do ANYTHING ELSE, use Chirp to READ your radio
and save the virgin codeplug under a name you will recognize.
I've been using the S/N plus "-original-factory-load.img",
ie "1234567890-original-factory-load.img"

The guys that develop Chirp are always looking for the
latest codeplugs and just in case yours is a new one.....

52377. Is this radio certified ?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-29 05:11:48 UTC
From: Phil
Topic: 52377 Message: 52377

Today my UV5R arrived, before I installed the battery I noticed that it DOES have a Part 90 certification label on the back of the main unit where the serial number is (S/N US2013192039). Now, I'm aware how many Chinese products have phony certs of one sort or another, and Part 90 isn't really important to me as I have no intention of using it for commercial or public service use.

I'm just curious as somebody here said that it wouldn't be certified for the price I paid.

By the way, it programmed just fine and audio reports through the repeater that's perhaps 25 air miles away (Mt Bullion) said it sounded very good (didn't try the speaker mic yet).

Receive audio seems better than I expected too, but there is a bit of a warble in the receive audio ONLY when the set isn't full quieting (weak signal). When it's full quieting it isn't there. Might be DSP artifacts, is this normal?

Paul,

I assume that you still have your UV-5R and you can program it so your driver shouldn't be an issue. The other common problem is not getting the 2-pin plug full inserted into the socket. Sometimes you have to press on the plug during the transfer.

Also I noticed that when I went to Setup -> Communications Port in the programming software, my unavailable ports were greyed out and my available port was black but it was not selected, After I selected the correct port I attempted a download and captured the "cloning request". This is radio is definitely not related to a UV-5R.

I have around 10 frequencies programmed and one of the repeaters buzzes every time it hits repeater frequency....146.805. It does not stop on that frequency but keeps cycling.

I have read that prolonged use can cause this thing to get better. For now, I move it to a different spot....sometimes works.....

Any feedback appreciated! THANKS!!!

That many bad ones is a record. However, I was told with the Chinese slowdown some parts suppliers are shuttering. This meant Baofeng and others were trying to dig up as many parts as possible to complete whole units and some had QA issues (again)

One Chinese broker we used stated a 20% return rate on some of the units.

Bottom line: Buyers Beware insure a Return Policy so you can return the unit if bad.

Having fun in 100F+ Vegas

Part 90 is usually the version sent to USA dealers.

However, that went out the window when the HP versions came out. I have not seen an 8W HP or TRi-power HP with a Part 90 sticker yet.

Most likely it was a version sold for US dealers off Amazon.

Subject: [baofeng_uv5r] Is this radio certified ?

Today my UV5R arrived, before I installed the battery I noticed that it DOES have a Part 90 certification label on the back of the main unit where the serial number is (S/N US2013192039). Now, I'm aware how many Chinese products have phony certs of one sort or another, and Part 90 isn't really important to me as I have no intention of using it for commercial or public service use.

I'm just curious as somebody here said that it wouldn't be certified for the price I paid.

By the way, it programmed just fine and audio reports through the repeater that's perhaps 25 air miles away (Mt Bullion) said it sounded very good (didn't try the speaker mic yet).

Receive audio seems better than I expected too, but there is a bit of a warble in the receive audio ONLY when the set isn't full quieting (weak signal). When it's full quieting it isn't there. Might be DSP artifacts, is this normal?

Subject: Re: [baofeng_uv5r] UV-8dr Anyone managed to program one?

Paul,

I assume that you still have your UV-5R and you can program it so your driver shouldn't be an issue. The other common problem is not getting the 2-pin plug full inserted into the socket. Sometimes you have to press on the plug during the transfer.

Also I noticed that when I went to Setup -> Communications Port in the programming software, my unavailable ports were greyed out and my available port was black but it was not selected, After I selected the correct port I attempted a download and captured the "cloning request". This is radio is definitely not related to a UV-5R.

The 7900 is what I use too, Super Gainer along with the Diamond motorized antenna raise/lower gear box. This setup will allow great gain and the ability to lower the antenna when you need to such as parking garages or a low clearance drive-thru.

From: mailto:baofeng_uv5r@yahoogroups.com

To: baofeng_uv5r@yahoogroups.com
Subject: RE: [baofeng_uv5r] CB/HAM Antenna

At the frequencies you'll be operating on, the mount is agnostic (or else you won't find an antenna with that specific mount, hence my inability finding a 440 MHz antenna with a 3/8-24 mount).

The coax will have greater loss at higher frequencies, but at mobile lengths and power it will be negligible. Bigger is better, but trust me, you'll end up with RG-58.

Choose your antennas based on their specifications for the frequencies you plan to operate on.

I didn't buy it for a Baofeng, but I chose the UHF/PO mount Diamond CG-7900 VHF/UHF antenna for two reasons - because it's tall enough to get well over my topper when mounted on the rear stake hole mount, plus it has a wide enough bandwidth to operate outside the Amateur frequencies and into LMR.

Roger KJ4AJP
WQHP866 KNGP280 WNMR760 KQT5542

****
You were absolutely right Roger. Sometimes it takes me awhile to fill in the gaps where I just don't know what I just don't know.

As far as the mounting bracket, I've seen several postings with manufacturers and parts. No problem there. But what I haven't seen is what bands they operate on. I (so far) haven't been able to tell if they cover 2m/440 or not. I'll keep looking, but if anyone here has experience with a mobile antenna and cabling for the Baofeng then I sure wouldn't mind being given specifics.

Thanks again,
Andrew

Someone might want to correct me but would they need FCC tested again for Part 90 use since they have been changed from the initial 5W tested versions?

I would imagine testing for spurious noise and harmonics would be needed as the chipset and firmware was changed allowing the higher power levels.

The original FCC Part 90 was listed for the specs under the 5W versions.

Mike,
Oh yes, the first thing I did after I got Chirp working was to keep a copy of the original 'load'. When I checked around the Chirp site I didn't see any place to send such files to though. One link on the site was blocked by my Avast virus scanner as a "malware" link.

From: garyflyskites@...
Topic: 52402 Message: 52402

Looking for a way to extend the "TOT transmission timer" on my radio. The max setting is 600 seconds (10 Minutes) I am a member of a performance kite team. We are currently using Midland family band radio with a switch modification I did to allow me transmit up to a 20 minute range. But using family bands we are getting many broken transmissions. The suggestion of Baofeng came up at our last performance. Extending the TOT to a minimum of 20 minutes or 1200 seconds is what we are looking for. Thanks in advance for any assistance.

Gary M.

No, the max is 600 seconds. I'm told that maybe in the past versions.

Gary, you'd actually have another problem to deal with as well since the UV-5R doesn't have a heat sink that would allow solid 20 minute 4 to 5 watt transmissions.

At high power, you'd literally burn up the radio, but the end of your kite performance would certainly end far differently than most, as the flames would get everyone's attention.

You "might" be able to get away with 1 watt low power for 20 minutes solid, but even then you'd really be pushing it I think (and that's assuming you could somehow modify the firmware to allow 20 minute long transmissions).

With all the FCC's emphasis on RF protection I'd be surprised if they'd certify any VHF handheld (which is usually held within inches of one's head when transmitting) that has an 8 watt output. By the FCC's specs, as I recall them, 5 watts is pushing their RF protection limit when held within a couple of inches from one's head. Of course as hams and on the ham bands we "self certify" with the information that is in the regulations. Dave J AF0DJ

Subject: Re: [baofeng_uv5r] Is this radio certified ?

What we are talking about is "FCC Part 90 Certified" radios that are also 8 watts. The Baofeng Tech model (BF-F8HP) outputs 8 watts on VHF and 6 watts on UHF, but is not FCC Part 90 certified (which is not required for ham radio use but is required for commercial use).

"Most" dealers also feel that the FCC Part 90 certification also means the radios meet a higher level of quality control from Baofeng China, but other dealers (like Baofeng Tech in SD) will claim Part 90 means nothing.

My issue with many of Baofeng Tech's claims (and of their sister company Anytone Tech), is they have a tendency to "s-t-r-e-t-c-h" the truth about many of their stats, especially when comparing their products to the rest of the Baofeng radio product line. Most new buyers won't find this out, of course, until after the purchase has been made.

Unless your group has a license in the Land Mobile Radio Service (FCC part 90), you can't transmit legally for 1 second let alone 1200. If your group was licensed, you probably wouldn't be using "family band" radios.

That out of the way, I'm not sure that the radios would survive keyed up for that length of time. They aren't designed for that kind of duty-cycle. Maybe they would survive for that length of time set to LOW power.

I was able to bump my BF-F8HP up to 615 seconds. Setting the memory byte any higher and the value wraps around to 15 seconds. So without a custom firmware, you are probably out of luck with any Baofeng radios that I am familiar with.

Since i sounds like you're planning on getting or already have your license perhaps you should consider a JT270M mobile unit for about $140. It's 10W though I'm not sure about any transmit time limits. And I believe there's one unit under $100 now.

One of the reasons you're having problems is you no doubt do 360's and loops, right? You're changing the antenna angle all the time which changes where all your transmit energy goes. Antennas are directional.

With a small 10W mobile unit and a decent half-wave dipole mounted on your frame you should do OK. You want it sideways for 2 reasons. One to transmit power downwards/upwards and two to NOT transmit power towards you.So you point the antenna towards your head which is the lowest emission direction.
I assume your frame is composite or non-metallic wire and not aluminum, right? Metal will mess things up.Mount two .5m wires on your frame and solder an antenna cable (shielded) to both ends in the middle to connect to the radio.
The pattern will look like this -- note the low emission would be pointed towards you if you mount the antenna on a vertical element of your kite with the center of dipole at head height.

Another thing you may find works is a passive antenna if you can mount your FRS radio very near (put the center of the FRS antenna wtih an inch of the center of the antenna) from a dipole which has two .15m legs the energy from your FRS radio will couple to the antenna and retransmit. Your FRS power may be enough to do the job with right antenna. You'll want to use minimal power since you are just a few feet from the transmitter.

It's not recommended to run UHF at higher powers that close to you (mainly your head) for such extended periods. That's why they have part 90 certifications on radios is to ensure they meet emission safety standards.But having the antenna pointed the correct way solves almost all of that problem. You should test the RF exposure where your head resides while flying as a good safety measure.If you have a picture of your kite we might be able to recommend a mounting point. As far away from as you can get and vertical with the center of the dipole at head height.

Thanks but no thanks.

#1. With the Diamond SG7900 (not recommended for mag mount) on the driver's side rear with 5W I'm full quieting into the two repeaters I'm interested in.

#2. With the SG7900 on the driver's side rear I've made successful contacts with the Net Control of a 2M FM Emcom simplex net 35 miles away with 50W., and casual QSOs to a station 10 miles away at 10W.

#3. With the Tram 1180 on the driver's side front and D72 at 1W I'm consistently tracked on APRS.

#4. I like the aesthetics of an antenna on each corner of my vehicle.

So seriously, why should I go to the trouble of drilling holes and rerouting coax to chase your theoretical performance gains when in practical application I'm already achieving everything I want?

Even a 10 minute transmission is abusive. There is absolutely neither need
nor any excuse for such conduct.

The only thing I can think of more abusive than these [people] transmitting for 20 minutes continuously just so they can tie up a frequency for themselves would be them doing so with 10 W power so they can tie up the frequency over an even greater area.

Why would this be abusive? Ever heard two parties chatting away for 30 minutes plus on completely inane subjects? As long as it's an unused frequency I somehow fail to see the problem compared to what anybody else does.It most certainly isn't illegal as long as you stick your call sign in as required every 10 minutes. And it seems the FCC planned on us talking longer than 10 minutes. 10W with the dipole mounted vertically will have very little radiation towards the horizon. Of course banking and looping will affect that a lot.
Better to leave the radio on VOX so you're not constantly keyed. That would solve the UV-5R limit and Gary quite likely does't know about VOX. I'd still stick a dipole on the UV-5R for the same reasons already given.

52419. Help a newbie with a uv-5r

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-30 03:51:35 UTC
From: redgoat_co_nv@...
Topic: 52419 Message: 52419

Help please.

I recently got a uv-5r, I was able to program it to the frequencies/channels that I wanted and it will transmit fine but it won't receive incoming transmissions. I am trying to use this for airsoft and using GMRS/FRS frequencies. What am I doing wrong? The guys on my team are all having the same problem, we made sure that we all have the same firm ware and we tried to program using both the baofeng and chirp programs. It is beginning to really frustrate me. If I hold down the moni button on the side while someone is transmitting then it will receive but otherwise it wont. We have tried it on all of the different squelch settings. Anybody have any ideas?
Thank You

Why would this be abusive? Ever heard two parties chatting away for 30 minutes plus on completely inane subjects? As long as it's an unused frequency I somehow fail to see the problem compared to what anybody else does.It most certainly isn't illegal as long as you stick your call sign in as required every 10 minutes. And it seems the FCC planned on us talking longer than 10 minutes. 10W with the dipole mounted vertically will have very little radiation towards the horizon. Of course banking and looping will affect that a lot.

If he was using a repeater you might have a point.
He's using a frequency for his own purposes which is perfectly fine as long as he's licensed and not interfering with anybody else.

Some people simply cannot comprehend that radio spectrum is a limited resource that has to be shared. ANYONE with a two-way radio staying keyed for 20 minutes straight is abusing the airwaves even on frequencies where doing so is legal.

Better to leave the radio on VOX so you're not constantly keyed. That would solve the UV-5R limit and Gary quite likely does't know about VOX. I'd still stick a dipole on the UV-5R for the same reasons already given.

The first thing you are doing wrong is ILLEGALLY trying to use this radio on GMRS and FRS frequencies.
The second thing you are doing wrong is ILLEGALLY using this radio without a license.
The third thing you are doing wrong is that you are trying to use CTCSS or DCS without understanding what it is or how it works.

I think the GRMS license is dropping from $90 to $65 for five years. A much better price but still not free. One of the fees are going.

As a reminder, since this is a Baofeng conversation, these radios are not legal for GRMS use.

Vanity call....hmmm, something to consider. But, I've had my call for so long it just wouldn't feel right to change it.

I did notice they had some RF exposure requirements listed for the Part 90 cert grant for the V2. These fell on the operator being trained on certain conditions and limits on Duty Cycle.

Subject: Re: [baofeng_uv5r] Is this radio certified ?

With all the FCC's emphasis on RF protection I'd be surprised if they'd certify any VHF handheld (which is usually held within inches of one's head when transmitting) that has an 8 watt output. By the FCC's specs, as I recall them, 5 watts is pushing their RF protection limit when held within a couple of inches from one's head. Of course as hams and on the ham bands we "self certify" with the information that is in the regulations.

To: "'R Pryor MAEd CETsr' doopsnoop@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>
Sent: Saturday, August 29, 2015 3:34 PM
Subject: Re: [baofeng_uv5r] Is this radio certified ?

What we are talking about is "FCC Part 90 Certified" radios that are also 8 watts. The Baofeng Tech model (BF-F8HP) outputs 8 watts on VHF and 6 watts on UHF, but is not FCC Part 90 certified (which is not required for ham radio use but is required for commercial use).

"Most" dealers also feel that the FCC Part 90 certification also means the radios meet a higher level of quality control from Baofeng China, but other dealers (like Baofeng Tech in SD) will claim Part 90 means nothing.

My issue with many of Baofeng Tech's claims (and of their sister company Anytone Tech), is they have a tendency to "s-t-r-e-t-c-h" the truth about many of their stats, especially when comparing their products to the rest of the Baofeng radio product line . Most new buyers won't find this out, of course, until after the purchase has been made.

Since i sounds like you're planning on getting or already have your license perhaps you should consider a JT270M mobile unit for about $140. It's 10W though I'm not sure about any transmit time limits. And I believe there's one unit under $100 now.

One of the reasons you're having problems is you no doubt do 360's and loops, right? You're changing the antenna angle all the time which changes where all your transmit energy goes. Antennas are directional.

With a small 10W mobile unit and a decent half-wave dipole mounted on your frame you should do OK. You want it sideways for 2 reasons. One to transmit power downwards/upwards and two to NOT transmit power towards you.
So you point the antenna towards your head which is the lowest emission direction.

I assume your frame is composite or non-metallic wire and not aluminum, right? Metal will mess things up.
Mount two .5m wires on your frame and solder an antenna cable (shielded) to both ends in the middle to connect to the radio.

The pattern will look like this -- note the low emission would be pointed towards you if you mount the antenna on a vertical element of your kite with the center of dipole at head height.

Another thing you may find works is a passive antenna if you can mount your FRS radio very near (put the center of the FRS antenna wtih an inch of the center of the antenna) from a dipole which has two .15m legs the energy from your FRS radio will couple to the antenna and retransmit. Your FRS power may be enough to do the job with right antenna. You'll want to use minimal power since you are just a few feet from the transmitter.

It's not recommended to run UHF at higher powers that close to you (mainly your head) for such extended periods. That's why they have part 90 certifications on radios is to ensure they meet emission safety standards.
But having the antenna pointed the correct way solves almost all of that problem. You should test the RF exposure where your head resides while flying as a good safety measure. If you have a picture of your kite we might be able to recommend a mounting point. As far away from as you can get and vertical with the center of the dipole at head height.

I think you are out of luck, Gary, unless someone here has the ability to reprogram the firmware on the chip.

Looking for a way to extend the "TOT transmission timer" on my radio. The max setting is 600 seconds (10 Minutes) I am a member of a performance kite team. We are currently using Midland family band radio with a switch modification I did to allow me transmit up to a 20 minute range. But using family bands we are getting many broken transmissions. The suggestion of Baofeng came up at our last performance. Extending the TOT to a minimum of 20 minutes or 1200 seconds is what we are looking for. Thanks in advance for any assistance.

old school question as I am still learning ..

wire antenna ??

for camping - toss a string with fishing weight over a branch - pull up your wire antenna - secure your string to something on ground other side. when done remove fishing weight and pull wire with string back over branch

Nope, Scott's link clearly states the FCC is eliminating both fees:

"In this document, the Federal Communications Commission (Commission) eliminates the regulatory fee components of two fee categories, the amateur radio Vanity Call Sign and the General Mobile Radio Service (GMRS)"

"After analyzing the costs of processing fee payments for GMRS, we conclude that the Commission's cost of collecting and processing this fee exceeds the payment amount of $25."

Similar discussion re: vanity calls.

Emergency???? Somebody would pick a random unused frequency for that? Good luck with that.
What Gary was probably doing is giving a "show description" to the crowd below.
There are at least two legal considerations.#1 Whether or not his team is getting paid. If so, they would need a commercial license.#2 If all he is doing is giving a show description then that sure sounds like "broadcasting"....and would need a commercial license. A Part 90 UV-5R would work fine then and probably work fine on low power too.

Can you "broadcast" with FRS or GMRS legally?

Hi Gang:

Essentially, the GMRS service is an extension to FRS, but with the possibility of repeaters and higher power. At least, getting a license for your “22 channel” walkie talkie will make it legal to use the upper channels. And being “free”.. more people might just do so. I would hope the FCC would have some sort of on-line licensing mode for GMRS.

Regarding the amateur radio vanity callsigns, things were often tough for the FCC: Consider that every so often, a very desirable callsign would become available (when the holder went SK). There could have been hundreds of applicants for the call, each of whom would send in the requisite payment. And all but one payment would have to be refunded. That was what was costing the FCC more money than it was worth to charge a fee. With the new system, the FCC will roll the dice, and one lucky ham will get the callsign he wants. All the rest will simply have to wait or choose another possible call.

Me? I’m sticking with my original call. Who would want it, but me? OK, maybe one of my grandkids, should any of them become interested in ham radio after I go SK. Don’t see any of them becoming interested as particularly likely, however.

For those anxiously awaiting September 3rd, remember this notice.

FCC website maintenance in early September will make the Universal Licensing System (ULS), the Electronic Comment Filing System (ECFS), the Electronic Document Management System (EDOCS), and other public applications unavailable for more than 5 days. The Commission said the outage will begin at 2200 UTC on Wednesday, September 2, and continue through the Labor Day weekend. The maintenance work should be completed by 1200 UTC on Tuesday, September 8. During the ULS outage, it will not be possible to file any Amateur Radio applications.

Two hundred feet may be a practical limit (depending on the frequency in use), but I believe that it is a particular field strength, not just raw distance. I believe that at one time, the FCC specified the length of the antenna wire used for the “broadcast” emitter. IIRC, is was a 50 foot wire for the AM band, and a 5 foot wire for FM band. These were Part 15 usages of the broadcast bands. Later on, it was a field strength measurement that was the limit. (so many microvolts per meter).

I think there is a Part 15 Broadcaster website and/or group which may have more detail.

From: Roger Elmore
Topic: 52425 Message: 52443

I believe Roy is correct. Greg, note your quote mentions $25. This clarifies it a bit:

http://www.buytwowayradios.com/blog/2015/05/fcc_eliminates_gmrs_regulatory_fee.aspx

"The GMRS license required two fees, the application fee and the FCC regulatory fee"

and...

"The fee, which was previously assessed at $5 per year, added $25 to the total cost of a GMRS license, which has a term of five years. While it does not eliminate the cost of a license altogether, the complete elimination of the regulatory fee brings the total cost of a General Mobile Radio Service license from $90 down to $65."
--
Roger WQHP866

****
Greg Ames wrote:
Nope, Scott's link clearly states the FCC is eliminating both fees:

"In this document, the Federal Communications Commission
(Commission) eliminates the regulatory fee components of
two fee categories, the amateur radio Vanity Call Sign and
the General Mobile Radio Service (GMRS)"

"After analyzing the costs of processing fee payments for
GMRS, we conclude that the Commission's cost of collecting
and processing this fee exceeds the payment amount of $25."
****
Roy Lewis wrote:
I think the GRMS license is dropping from $90 to $65 for
five years. A much better price but still not free. One of the
fees are going.

For those anxiously awaiting September 3rd, remember this notice.

FCC website maintenance in early September will make the Universal Licensing System (ULS), the Electronic Comment Filing System (ECFS), the Electronic Document Management System (EDOCS), and other public applications unavailable for more than 5 days. The Commission said the outage will begin at 2200 UTC on Wednesday, September 2, and continue through the Labor Day weekend. The maintenance work should be completed by 1200 UTC on Tuesday, September 8. During the ULS outage, it will not be possible to file any Amateur Radio applications.

Pity they don’t adopt our system. UHF CB (80ch Narrowband, 5w, FM only – no limit on antennas/gain) is a free class license. Repeaters are allowed (but require an individual license and must be public access, with auxiliary power. 27 Mhz 40ch AM/SSB CB is also permitted under a similar arrangement.

Hi Gang:

Essentially, the GMRS service is an extension to FRS, but with the possibility of repeaters and higher power. At least, getting a license for your “22 channel” walkie talkie will make it legal to use the upper channels. And being “free”.. more people might just do so. I would hope the FCC would have some sort of on-line licensing mode for GMRS.

....
GMRS was created decades before FRS. FRS is an entirely different radio service. At any rate, this is off topic for this group, since it is illegal to use these radio services with BoofHongs.

Emergency???? Somebody would pick a random unused frequency for that? Good luck with that.
What Gary was probably doing is giving a "show description" to the crowd below.
There are at least two legal considerations.#1 Whether or not his team is getting paid. If so, they would need a commercial license.#2 If all he is doing is giving a show description then that sure sounds like "broadcasting"....and would need a commercial license. A Part 90 UV-5R would work fine then and probably work fine on low power too.

Can you "broadcast" with FRS or GMRS legally?

Mike W9MDB

You cannot broadcast on these radio services. It is in the regs.

> Emergency???? Somebody would pick a random unused frequency for that?
> Good luck with that.

It doesn't matter what frequency someone in an emergency picks. But it is actually quite likely that someone might choose an occupied frequency instead of blindly transmitting off into nowhere.

> What Gary was probably doing is giving a "show description" to the crowd
> below.

And they need to tie up radio spectrum to tell people something they can SEE for themselves. Wow! I guess they assume the "crowd" is really stupid.

> There are at least two legal considerations.
> #1 Whether or not his team is getting paid. If so, they would need a
> commercial license.

Actually there are frequencies where you can be paid to transmit and still not need a license.

> #2 If all he is doing is giving a show description then that
> sure sounds like "broadcasting"....and would need a commercial license.

Likewise as with #1, there are radio services that do not include the ban on "broadcasting" -- in fact, as I recall, the Amateur Radio Service is the only radio service in the US which does include a specific ban on broadcasting.

> A Part 90 UV-5R would work fine then and probably work fine on low power
> too.

I'd love to have them figure out how to bypass the TOT on the UV-5R, and use it on high power.

That way they'd fry the radio.

A 5 watt panel doesn't need a controller to trickle charge a lead-acid battery.

An easy way to use it is: - hook the panel up to a small lead acid motorcycle battery 24/7. (A larger lead acid battery is OK.)
- charge your UV-5R by connecting to the battery a UV-5R car adapter that regulates the voltage to match the UV-5R charger.

The solar panel will generates up to 18 volts during peak sun. The battery acts as a buffer and allows you to charge the UV-5R day or night.

There are several threads re: which car adapter's supply the required voltage.

52457. Baofeng Extended Battery Pack BL-5L

My Fellow Hams,
I have several of the Baofeng HT, that I like. For my last birthday, at my request, I was given a Baofeng UV-5R with the extended battery pack model BL-5L. I was very pleased how loooong it lasted. Some of our local hams and I work an all night and most of the next day sporting event; over the years I have used half a dozen HT's for my position. Along about dawn, no matter what brand of HT, the batteries usually die after a long night. The UV-5R's extended battery back lasted until mid day when I was done, then a friend borrowed the UV-5 for another 3 hours and it was still running strong on the original extended battery pack when I picked it up to go home. If you need a long time use with one radio the extended battery pack is worth it! The HT and battery pack were purchased from Amazon.

Ah I see. LMR?

I was thinking that they could just make the existing FRS/GMRS a class license. We went through this nearly 40 years ago now, the revenue from licensing was way less than the cost of collection and enforcement – so they cut the Radio Inspectors back severely and made it a free class license instead. Still a few RIs around, but nothing like the numbers they had in the 60's when you needed a 'Broadcast Listeners License' to watch tv or listen to a radio. That went for similar reasons (not to mention it was very unpopular).

High or low power? I'd like to be some where I can
reach the tower on low power, longer battery life.

The one time I needed radio for event, I made the
mistake of trying the magnet mount antenna, and
blanked out the receiver. Ought have used only the
rubber ducky. Sigh. Didn't know about the front end
over load. I'd also brought spare battery, cell phone,
backup, backup.

One earlier event, using bozo band handi talkies, the
radios they had featured a high or low power switch on
the side. High power had no audio, and low power was
very good. I spent the entire event trying to get people to
switch to low power so I could hear what they had to say.

I'm with you, the one bicycle marathon I assisted, I did
bring a spare battery.

Another radio group loaned us some mobile go packs. They
all had Anderson Powerpole, and no one could adapt to them.

Days later, they found the separate bag wtih the lighter plug
adapters (should have been one in each of the go boxes,
would that be nice!).

Lot of lessons from that day.

52463. F8-HP battery levels for 8w TX

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-31 02:01:19 UTC
From: Michael D Earls
Topic: 52463 Message: 52463

Apparently, at tonight's net check in, I was transmitting carrier only at 7.1v.

I picked up another identically programmed F8-HP (8.2v) and checked in.

Previously, I had noticed a complete failure to transmit at 8 watts abt 6.5v or less so I didn't expect to be able to hit the repeater but transmit no audio.

Has anyone else noticed this?

Maybe later this week I'll start with fully charged batteries in both radios and test at what level TX ceases and whether there is an interim level where carrier only is TX.

At 18v the panel would be at 270 ma which is lower than the specified base current. Plus the base would need something around 10 v + 2v. I bet these have no charge controller in them and would not have a charge sense for Li-ion batteries.

At a drop to 10volts keeping a 5W output would be 500 ma.

I would avoid them for a controlled 12volt DC 500ma panel and use a TYT base. As a matter of fact I would use a car accessory socket from the panel/controller (12vdc) into one of the accessory socket 12vdc to 12 -10vdc regulators into the TYT base giving you a two stage regulation protection and the TYT base would have a charge sense on it. Some of these panels have really wide voltage fluctuations making a solar controller a must. Try for a 10W or higher panel.

I run a solar battery tank and a 6 port charger base on a 60W panel. Load is always 13.8-12vdc adjustable.

No. You could broadcast in the various broadcast bands with very low power transmitters (there are specs for the amount of signal you can legally use). Some people have very low power transmitters to transmit music (or whatever) to their patio radio. Once upon a time, outdoor movie drive-ins would use a QRP FM transmitter to send audio to the movie-goers.

They could just unkey every couple of minutes, reset the TOT and not worry about it. Who are they transmitting to that would be listening to this? If 'broadcasting' to a crowd, get a PA system.

Good Morning,
I use high power, but I am mostly listening for results for the AuSable River Canoe Marathon. I do carry spare batteries, HT's mobiles and antennas, etc. One ham is with the Timers down by the water, his partner is upland a ways to get into a local repeater with a mobile from the car. so we have a mix of mobiles and HTs. I work with the local radio stations and two on the spot reporters giving results.

A few hams use Anderson Power Poles. Think most use cigarette lighter plugs or have their mobiles wired to the car battery. This is the best way. A few have stand alone batteries with their mobile radios and there fore portable. One problem with the cigarette lighter plugs is most have a max of 10 amps. If you use one of the high power mobiles, like the Icom ICV8000 will draw more on high power, blowing fuses. No problem if run at low or medium power.

At the very least you would want to have a storage battery to handle peak loads which exceed the output limits of the panels. Also consider that just because the theoretical output power of the radio is 5 watts, doesn't mean that the load on your power source will be limited to 5 watts. There are other drains such as heat loss which will increase the load somewhat plus the peak surge when you key up which will create some level of spike at the beginning. All taken care of with a storage battery as long as your mean load doesn't exceed your mean charge power. Of course a fully charged battery at the start will help kick things off nicely.

Don't hold your breath waiting to see a no cost GMRS license in September.

So far as GMRS goes, the notice only calls for eliminating the REGULATORY fee (which it lists as $25 which is the correct amount for the Regulatory Fee). I don't see anything about eliminating the APPLICATION FEE which is $65.

The current fee schedule for GMRS licenses is:
New, Renewal or Renewal/Modification
• FCC 605
• FCC 159
• Application Payment/Fee Type Code: PAZM - $65.00 Fee AND
Regulatory Payment/Fee Type Code: PAZR - $25.00 (Per Call

Eliminating the Regulatory Fee would not change the application fee without a separate action by the FCC.

52476. Took my "Bow-Fung" radio for a walk this morning, worked fine

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-31 16:50:40 UTC
From: Phil
Topic: 52476 Message: 52476

This morning I went for my usual walk. It's been awhile since I had an HT to take with me, so it was nice to be able to walk and chat at the same time. It makes the walk go faster, though I walk fast and get out of breath when walking/talking (Hey, I had my 72 B-day this month). When I start my walk I usually sign on the repeater as "KO6BB, taking my "imaginary Hound-Dawg" for a walk. Hmm, maybe I should name my UV5R "Bow-Fung", (for "Bow-Wow"), get it?

The radio performed flawlessly, I couldn't be more pleased with it. The local Merced remote receiver is down right now so I connected directly to the Mount Bullion repeater (25 air-miles or so). Just used the factory "rubber dummy load", but it didn't seem to have any more (maybe less, conditions change) drop outs than I used to get on the "high dollar" Yaesu FT-60. I put the 440 freq in "A" and the 147 freq in "B" and tried both. I got excellent audio reports on both links.

So anyway, I couldn't be more pleased with my purchase, definitely the best "new radio" buy I ever made!

Correct,

This is why I highly suggest using a Storage tank (battery) especially for any electronic equipment.

The storage tank (names the solar industry uses) should be specifically a version rated for solar equipment.

Subject: Re: [baofeng_uv5r] solar charger from car battery...

At the very least you would want to have a storage battery to handle peak loads which exceed the output limits of the panels. Also consider that just because the theoretical output power of the radio is 5 watts, doesn't mean that the load on your power source will be limited to 5 watts. There are other drains such as heat loss which will increase the load somewhat plus the peak surge when you key up which will create some level of spike at the beginning. All taken care of with a storage battery as long as your mean load doesn't exceed your mean charge power. Of course a fully charged battery at the start will help kick things off nicely.

---In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote :

At 18v the panel would be at 270 ma which is lower than the specified base current. Plus the base would need something around 10 v + 2v. I bet these have no charge controller in them and would not have a charge sense for Li-ion batteries.

At a drop to 10volts keeping a 5W output would be 500 ma.

I would avoid them for a controlled 12volt DC 500ma panel and use a TYT base. As a matter of fact I would use a car accessory socket from the panel/controller (12vdc) into one of the accessory socket 12vdc to 12 -10vdc regulators into the TYT base giving you a two stage regulation protection and the TYT base would have a charge sense on it. Some of these panels have really wide voltage fluctuations making a solar controller a must. Try for a 10W or higher panel.

I run a solar battery tank and a 6 port charger base on a 60W panel. Load is always 13.8-12vdc adjustable.

I haven't used this particular model, but I have used a Goal Zero Nomad unit to recharge some of my TYT and Baofeng batteries while out camping. Just check the battery condition and voltage regularly to avoid any nasty surprises from the battery.

Too bad they ruled against those with a Ham license and a GMRS license, to be able to use the Uv5R on GMRS repeater pairs.

If I want to access a GMRS repeater I need to use my other radio and carry both of them.

From: mailto:baofeng_uv5r@yahoogroups.com

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] GMRS license

Don't hold your breath waiting to see a no cost GMRS license in September.

So far as GMRS goes, the notice only calls for eliminating the REGULATORY fee (which it lists as $25 which is the correct amount for the Regulatory Fee). I don't see anything about eliminating the APPLICATION FEE which is $65.

The current fee schedule for GMRS licenses is:
New, Renewal or Renewal/Modification
• FCC 605
• FCC 159
• Application Payment/Fee Type Code: PAZM - $65.00 Fee AND
Regulatory Payment/Fee Type Code: PAZR - $25.00 (Per Call

Eliminating the Regulatory Fee would not change the application fee without a separate action by the FCC.

Well, I don't run solar here, but I DO have a "storage bank". My "station battery" consists of 3 120Amp/hr deep cycle batteries in parallel, kept on float charge 24/7 by an Astron 20M power supply. ALL the 12 Volt station equipment, (including some not in my signature line), emergency lighting (homebrew 72LED light bar), the DSL modem & router, 300W 110V Inverter and so forth all run off the "station battery" through appropriate fused fused power strips etc. Some of the radios (the 2 Icoms, Yaesu FT-1900, Modem/Router etc) are left on 24/7 and the usual 'draw' off the Astron is typically 5 Amps (goes up when I'm transmitting).

I DO want to get a mobile charger for the UV5R so I can recharge it off the station battery should the need arise. . .

Just get the tyt base and run it from a solar panel I would use something around 10W or higher. For a battery load an emergency 3.6 ahr 12v gell cell would make a good battery/panel combo

Date: Sun, 30 Aug 2015 06:31:07 -0500
Subject: Re: [baofeng_uv5r] Portable Antenna Masts (that don't empty savings)

old school question as I am still learning ..

wire antenna ??

for camping - toss a string with fishing weight over a branch - pull
up your wire antenna - secure your string to something on ground
other side. when done remove fishing weight and pull wire with
string back over branch

On 8/29/2

lowes painter telescopping pole handles

On occasion I'll go camping in
remote areas. I'd love a portable
mast that would serve two
purposes. (1) Support a HAM
antenna. (2) Support a Yagi
antenna for my cell/data booster.

Are there any reasonably high
(20' or more) portable telescoping
masts available on the market that
won't kill my budget? If so, any
help in locating them would be
greatly appreciated.

Thanks in advance,

Andrew

It will work but, depending on how you mount it, you might have trouble gettting it to work on 10. Little iffy trying to cover both bands without the SWR getting too high. Removing the tip might make it work on 10 and replacing it for 11. Might be easier than replacing the whole antenna. If you plan to switch antennas, I would suggest using a good quick disconnect like a Hustler. Also good for easy removal in parking garages, car washes, parking in unsavory neighborhoods, etc. I use roughly the same antenna on my car (not sure of length) with a remote impedance matcher like the Miracle Antenna. I can get a decent match on just about any HF band, efficiency is another matter (grin) although I've made good contacts on 75 and up. The mount, grounding and coax should not make a difference as long as it's done securely. A car body is not a good ground plane/counterpoise but it's the best you have, so make sure the connections are solid and check them regularly for corrosion. It's amazing how water can sneak into places. Plus check to see if any effect on the vehicle computer. I once had a corrosion problem (I'm assuming that's what it was) where the SWR jumped up and RF got into the car computer and shut the car down while I was on a highway doing 45. Only happened once, which was enough, lesson learned.

I know painting poles were mentioned. I know MFJ makes collapsible poles but that might be a budget breaker. I've seen "fishing poles" at Walmart that get almost there but the tops might be too flexible to support more than a wire. IIRC, there was an old QST article where some one made a "tower" out of PVC and heater hose clamps. I made a similar one out of stuff from the local home improvement store. It's about 25' tall, tripod base and fits in a longer "beach chair" bag. Check the back issues on the ARRL site or maybe some one here has the knowledge of the exact issue.

Subject: Re: [baofeng_uv5r] Portable Antenna Masts (that don't empty savings)

old school question as I am still learning ..

wire antenna ??

for camping - toss a string with fishing weight over a branch - pull up your wire antenna - secure your string to something on ground other side. when done remove fishing weight and pull wire with string back over branch

On 8/29/2

lowes painter telescopping pole handles

On occasion I'll go camping in remote areas. I'd love a portable mast that would serve two purposes. (1) Support a HAM antenna. (2) Support a Yagi antenna for my cell/data booster.

Are there any reasonably high (20' or more) portable telescoping masts available on the market that won't kill my budget? If so, any help in locating them would be greatly appreciated.

Thanks in advance,
Andrew

Here's where you can find Ed, WB6IQN, on eBay:

http://www.ebay.com/usr/antennas_iqn?rt=nc

You can't go wrong with Ed's stuff. Highly recommended!

I have tried various schedules and diameters of PVC and the best I could get before they tilted over under their own weight is about 10 feet. with the compression couplers which are stiffer than butt couplers. It is just too flexible to support it's own weight. That is with an Ed Fong PVC j-pole on top. Nothing heavier would work beyond about 6 feet.

I settled with extension (painter) poles. If using a yagi I set them up upside down so that the fiberglass section is on top to avoid interference with the nearby elements. Works great.

Well, this thing has three at the base as sort of a "stressed" tripod which is then clamped to a single piece. That's how it gets the extra height. Then I have it in sections for each "part" so it can all fit in the trunk.

Reckon I have enough room at this QTH for a very low 40m dipole, so I'll aim the left end at the horizon pointing west, and hope to work loads of American friends..... I don't suppose it will fire east off the right end at all, so no qrm from Europe.

It could not possibly fire upwards, and give me inter-G cover, so I will have to use my Baofeng for that, Hi Hi.

Don, I just raised my hand "circularly..." and it dam'n well hurt...!!! :-)

I accidentally connected a 24v, 500mA charger to the base charger of my UV5R. It was connected for no more than 10 seconds, and this is the result.... On the plus side, I have been wary of these cheap Chinese chargers, so it has given me the opportunity to look inside and see the bones. Not much to them at all, so I would probably recommend that nobody leaves these things on unattended. ☐☐

I accidentally connected a 24v, 500mA charger to the base charger of my UV5R. It was connected for no more than 10 seconds, and this is the result.... On the plus side, I have been wary of these cheap Chinese chargers, so it has given me the opportunity to look inside and see the bones. Not much to them at all, so I would probably recommend that nobody leaves these things on unattended. ☐☐

Hmm, very interesting. I just opened up the Model CH-5 charger on my newly purchased UR5R.

The circuit board layout is entirely different. Probably the same chip, it has 5 resistors (like the picture), but they're laid out very differently, and the Capacitor on flying leads comes out on the opposite side of the board. At first I thought that maybe it was a mirror image of the one in the picture, but it isn't.

As a side note, that little chip doesn't look like it could safely pass the 400mA that the charger is rated at, but I guess it does. I wonder if all the actual regulating is done in the wall-wart, and the chip simply acts as a "switch", on-off. That way it wouldn't have to dissipate any real power.

Not really surprising -- much of the Chinese electronics industry is almost would would have been called "cottage industry" in years past. Not quite the home assembly system of true "cottage industry" but multiple small factories producing products that are interchangeable without being identical. This is one of the many reasons that Chinese "quality control" is nearly non-existent.

52515. Question: Is the UV5R really an "SDR"

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-03 04:36:30 UTC
From: Phil
Topic: 52515 Message: 52515

Somewhere when I was browsing I say a 'spec' on the UV5R that said it was an "SDR" (Software Defined Radio).

Now yes, I realize that all modern radios have CPUs and firmware controlling them, but when I think of an"SDR" I think along the lines of the DACs and A/D converters etc, sort of like the famous Perseus or RF-Space receivers that have no conventional analog RF Amplifiers, Mixers and IF amplifiers etc.

Just wondering if the UV5R falls into that category, and if so, might explains some of the 'faults' of the set like wide open front ends that block easily, squelch opening on out of band signals etc. NO I haven't observed any of those problems in my set (yet), and in fact I'm an extremely happy camper with it. I wanted to get another HT to replace the one I swapped off a year or so back, but couldn't afford anything until I saw the ad for this one.

In fact, if it IS a true SDR, that would explain a lot about why they're able to market the set in the price range that they do, and change the set's parameters easily with firmware changes.

Whether the UV-5R (etc) radios are "true" SDR depends on just how tightly you care to define SDR.

Some people want to define SDR to only encompass a hardware module that is run by external software - obviously the UV-5R does not fall into this category. On the other hand, your implied definition of not using "conventional analog RF mixers" etc pretty much does fit this radio.

Take a look at http://www.uv3r.com/images/Schematic-Baofeng-UV5R.pdf and decide for yourself

no it's not. Its a standard radio with standard firmware and a couple of wind band transceiver modules.

btw, there is a push on by the FCC to lock down radios, computers and the like. that will, in turn, make these radios a lot more expensive in the long run.

Just remember though the schematic is a little off as the BJT's are actually Mosfet's (Who knows what else is off). The REAL true schematic is locked down and a copy sits at the FCC with a coding as "Not to be released."

Don't bet that they gave the FCC anything different - or anything accurate - for the schematic. The FCC doesn't check the schematic any more than they check any of the other material that an applicant provides. Which is how the UV-5R application got approved for Part 90 in the first place - by the company blatantly lying and the people at the FCC not even bothering to read the User Guide that the company provided (which makes it obvious that the radio is field programmable).

52521. Internal microphone problem

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-03 20:05:55 UTC
From: tkmracing@...
Topic: 52521 Message: 52521

I have a UV-5RA which has recently stopped transmitting voice. The signal/carrier is heard but no vox.
If I plug in an external microphone, it works fine, but when I speak into the internal mic it is not heard on the receiving radio.
Has anyone experienced this before?
Is it a software issue or a faulty internal mic??

Any help will be greatly appreciated.

u have anothe choice; it is the one I most often use and it is near 100% perfect in keeping out the noise: use TONES for rcv.

Your railroad likely has subtones; find it, set it, be done with all the hash noise.

I even use it on 146.52 with my friends who live within HT distance; I plolitely asked them to set 100hz on their xmt for me. Now I can ride all day in my electric golf cart and not have squelch breaking all the time from my hi performance PWM super drive.

And, of course, you either have your radio programmed with busy channel lockout, or you over ride your tone guard to verify a clear channel, before transmitting, right? No argument at all with tone guarding receive, but don't overlook the requirement to make sure a channel is clear before transmitting.

In the past, this was been a internal problem. Pushing and pulling the mic in and out causes a solder joint on the jack to fail because of cold soldering in the factory. Just open it and resolder. It is in detail on miklor.com

I'm not surprised at that. An FCC field engineer who retired a few
years ago made a comment in a conversation at a local ARRL
convention two or three years ago (and I'm paraphrasing here) "that
the FCC no longer has any "real' engineers in DC. They've been
retiring all the technical people over the last 20 years and replacing
the headcount with administrators, lawyers, bean counters and
political types that can handle congresscritters that want favors
for their constituents."

52528. How do I inhibit Xmit in chirp?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-07 17:07:35 UTC
From: Phil
Topic: 52528 Message: 52528

Hi All,
When I first got my UV5R I programmed in the local repeater and all it's remote access points (remote receivers), and also emptied all the extra memories that came per-programmed in the radio.

Now I want to put the weather channels, police and a few other things in the radio, frequencies where Xmitting is a no-no. I want to inhibit those channels just for safety reasons. I'm NOT one who modifies my HF rigs for 'MARS/CAP' (aka CB hacks). . .

Might be possible to put an offset on the non TX channels,
so that if someone accidentally push TX, it goes into a non
critical freq.

I had our local fire mutual aid channelin a 2 meter radio that had been MARS/CAPed, so I put a very large offset on
it so if the mike got keyed, it came outin the 2 meter band.

It isn't hard. If you want to manual program the radio there are
guides on the miklor.com website.

If you want to program using the computer, links to software and
guides are on the miklor.com website.
>
>
> so at any rate how do I find out what the fire police military weather -

A good place to start (if you are in the USA) would be radioreference.com

>
> than what other bands would be of the most use

These radios only have 2 bands. VHF and UHF.

The one that has the most use would depend on the services in your
area. NOAA weather radio is on VHF.

If you are going to monitor these types of services, it is important
that you program them using a computer so you can disable transmit on
those frequencies.

If you program using a computer, do yourself a favor and get a
programming cable with an FTDI chip.

Not necessary.

When you program the transmit side as "OFF" it does not
key the transmitter.

Hope that was a relatively unused freq in two meter. Not
a big issue, since it's only in case of accidental TX.

Good idea, in any case.

Apparently you missed the point, Christopher, it's never a "good idea" to have someone transmit on what you think is an used 2m frequency (during the minute or two you listened to the actual frequency) instead of simply turning off the transmit option in your programming software, including that it could be an repeater input, a satellite or 2m ssb frequency, or even a cross-band or net control frequency. So again, no, that's NOT a good idea, for a variety of reasons.

Good idea getting it right first time - usually the best plan, but occasionally some of us do make boo boo's. But that is what forums like this are for - to help solve these types of problems we have at times. The miklor website is your best place for reading up and learning how to go about programming your new radio. If you are planning on using the software for programming, highly recommended, download the latest build on the site - and of course you will need to pick up a programming cable - ebay and other places have them.

What frequencies you will need to program into your radio for listening will depend on what country you are in and also what area. Try doing a Google search for "scanning frequencies" in your area - eg: "scanning frequencies England+London" or as in my location "scanning frequencies New Zealand+Christchurch.

When using Google there are many useful tricks you can use to either refine or make your search more specific to your needs. Here is a link to a page that lists the many different wildcards or extra search options for Google -
http://www.lifehack.org/articles/technology/20-tips-use-google-search-efficiently.html

Actually Christopher, I *was* replying to your post (shown below):

"Hope that was a relatively unused freq in two meter. Not
a big issue, since it's only in case of accidental TX.

Good idea, in any case."

52549. Bellevontaine, OH?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-08 11:37:09 UTC
From: Christopher Young
Topic: 52549 Message: 52549

My father was in that town, about twenty or thirty years ago. His white Buick over heated, and he had it repaired there. The people were very nice. The locals were able to unsolder the radiator, rod it out, and solder it back together.

Courtesy change of subject line, we're no longer on chirp. This email came through the group, but kept trying to go some where else.

The last time, you put new text right over someone else's reply. This time, you got it (almost) right, format wise. You did leave a bunch of old text that's not relevant. I deleted the excess text before replying.

Now that you're replying to my post, you're welcome to comment, or add some thought or information.

52554. KC9HI URL for UV-5R Recovery Identified by Avast as Harmful

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-09 20:11:21 UTC
From: fredberry@...
Topic: 52554 Message: 52554

I am trying to recover a new UV-5RA that I inadvertently screwed up by uploading an older .img file before downloading the .img file in the radio first. I found instructions to fix this requiring an older version of CHIRP and accessing KC9HI's recovery website for the appropriate N5Rxx firmware (my radio reports N5R2407 w/BFB297 firmware). When I access the KC9HI recovery page Avast flags it as harmful. Is there another solution to this problem?

Thanks in advance.

Don't worry -- I run Avast here and it gives false alarms on various programs and sites that are known to be harmless.

You can use Avast to report the "false positive" to their developers but they actually won't do anything about the problem.

From: xaunloc@...
Topic: 52425 Message: 52561

Confirmed today (now that ULS is back online). GMRS applications (new and renewal) require the $65 application fee. Only the $25 regulatory fee was abolished.

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote :

Don't hold your breath waiting to see a no cost GMRS license in September.

So far as GMRS goes, the notice only calls for eliminating the REGULATORY fee (which it lists as $25 which is the correct amount for the Regulatory Fee). I don't see anything about eliminating the APPLICATION FEE which is $65.

The current fee schedule for GMRS licenses is:
New, Renewal or Renewal/Modification
• FCC 605
• FCC 159
• Application Payment/Fee Type Code: PAZM - $65.00 Fee AND
Regulatory Payment/Fee Type Code: PAZR - $25.00 (Per Call

Eliminating the Regulatory Fee would not change the application fee without a separate action by the FCC.

The ADA compliant version is called PAPER and the Assistive Technology used to support it is an assistant.

No, I am NOT being flippant. If you require more accommodation than your computer can provide with the online form, the alternative is to file the paper version of the form.

Windows 10 will (as a courtesy to you) will update all drivers. This includes your cable drivers.
Beware of a false positive.
Device manager in the past would show a Yellow Triangle indicating that it has the wrong driver.
This is no longer true. Device Manager will now show as good, but your cable will still fail.
If you are running a standard generic cable, you must backdate your drivers to 3.2.0.0

No, the point of ADA was NOT to require everyone else to do everything necessary to eliminate all the disadvantages that are inherent to any and all possible handicaps.

The point of the ADA was to require everyone to make REASONABLE accommodation to enable people who have handicaps to participate in society on as equal a basis as reasonably possible.

From: doc
Topic: 52573 Message: 52573

we are also covered by ADA here

not blind but some inability to get around and we both work with service dog

have found most people are accommodating and we try to meet them part way

we have shifted our seat in restaurant to help someone with fear of dogs, not required under ADA, but i think forcing someone to work against a phobia would be unreasonable of us, we have refused lesser seating arrangements [usually chinese eatery, they do not have a pet culture]

reasonable can be a tricky concept, but e g removing a chair from a table to allow wheelchair access or room for a service dog, no big deal specialized seating would be excessive.

will also point out govmnt likes to exempt itself from the rules us surfs get stuck with [look at the long list of laws that your 'representative' has exempted congress from] so may not be applicable to license app

Of course the "other" problem with Tim's request is that "if" the "A0xx" callsign prefix was available, he'd have to upgrade from General to Extra Class first, and then fight through the vanity call sign issues to get a 1x2.

According to the ITU list of call sign prefixes, A0SS would appear to be a perfectly valid call if the FCC chose to issue it. Specifically it would not conflict with any other allocation.

Topic: 52573 Message: 52576

"Reasonable" is always the key issue when honest people honestly disagree about the ADA. Unfortunately the examples that the public sees are almost always the instances of one side or the other being totally unreasonable.

My experience IN the government is that the US federal government wastes a lot of money providing totally unreasonable levels of accommodation but then turns around and fights over other accommodations that aren't AS outlandish.

The problem that many people choose to not understand is that no matter how reasonable anyone is, no one can accommodate every possible handicap, and it is especially impossible to meet everyone's PREFERRED accommodation. For example, you will note that just about all government buildings now have ramps to accommodate wheelchair access; but the design of many buildings results in ramps that are too steep for wheelchair users who have not built up extreme arm strength - other places manage to keep the ramp from being too steep, but the result is a ramp that is very long, which accommodates healthy wheelchair users but is unsafe for wheelchair users who lack the stamina and practice to handle long curved or zig-zag ramps. Meanwhile we have other buildings where the ramp REPLACED the steps -- making the building accessible for wheelchairs but completely inaccessible to many people relying on crutches.

In the case that started this thread, the FCC license application can be completed online by people with vision handicaps who use a magnified screen, but probably not by people who choose to use a screen reader. I was not being facetious when I told the original poster that the 'accommodation' available was the paper version of the form. The FCC is well aware that not everyone can complete the online form and has retained the paper form as an alternative for those who cannot access the online form (unlike some other federal agencies that have forms which exist exclusively online). I might mention that it costs the FCC several times as much to process the paper application compared to the online application which is a fully automated process (which makes the $65 application fee a real rip-off for the majority of us who file online).

And just how did you do that?

Your GMRS license record shows you are NOT EXEMPT for the application fee. If you filed without paying the fee, the computer will process your application and issue the license, but when the fee doesn't arrive, they will cancel your license and MAY withdraw your other licenses if the FCC decides you were trying to cheat the government.

Check the list you posted. The USA is only allocated callsigns beginning with AA through AL, not A and a number.

A0 isn't assigned by the ITU to any country because it doesn't conform to their plan.

Also it doesn't conform to the FCC's amateur callsign assignment system, which can be found at
http://www.ecfr.gov/cgi-bin/text-idx?&mc=true&node=se47.1.2_1302&rgn=div8

That's right. The system was configured wrong for a few hours. The fee is $65. The FCC knows who everyone was that took advantage of them during this time. I would expect them to contact everyone to have them "settle up".

I never said A0SS was a valid US callsign, I said it COULD BE, IF the FCC chose to use it. The rule you cited is the FCC's rule, and the FCC can change it any time they choose and has changed their system several times in the past (for example, the FCC only started using the N prefix amateur callsigns when they were close to running out of W and K callsigns under the system they had in use at that time). You might also note that while the FCC assigns all US amateur callsigns, it does not assign all US callsigns (note that you do not see any callsign in the pattern Three Letters, One Number, two or three letters anywhere in the chart in Section 2.302, but those callsigns are in use).

By your logic the US could not use a callsign beginning with K followed by a number, or W followed by a number or N followed by a number.

Subject: Re: [baofeng_uv5r] GMRS license

Check the list you posted. The USA is only allocated callsigns beginning with AA through AL, not A and a number.

A0 isn't assigned by the ITU to any country because it doesn't conform to their plan.

Also it doesn't conform to the FCC's amateur callsign assignment system, which can be found at
http://www.ecfr.gov/cgi-bin/text-idx?&mc=true&node=se47.1.2_1302&rgn=div8

Of course, Scott, but you did not submit an application -- Manuel DID submit and application (which was processed and a license issued) but claims that he did not pay the fee. The record for his GMRS license clearly shows that he was not covered by any of the exemptions for the application fee. When you get to the point where you chose not to submit your application, clearly he did submit his -- the next screen (which you did not reach) offers several options for how you want to pay the fee, including paying online with a credit card at a different US govt website, or printing out the Fee Remittance form 159 and mailing it in with your check or money order -- and includes the caution that the fee must be received within 10 days (I don't recall if that is working days or calendar days) or the application is invalid. If Manuel didn't pay the application fee, his brand new license is going to magically disappear in about two weeks, at which point he will receive a very interesting letter from the FCC asking him to explain his failure to pay the fee that he "signed" saying he was paying.

Ok. Ok. Ok. . It's $65 unless exempt. They(fcc) will find you or delete you.
As far as A0ss you can be known by that on your qrz biography. Just leave
out the "0"

52591. Another volunteer event after report

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-13 00:26:07 UTC
From: Christopher Young
Topic: 52591 Message: 52591

Sept 12,2015.

I signed up to be a helper of some sort or other, on a bicycle marathon. There were going to be 100, 62, and 30 mile routes.

First lesson: The assignment in the email from the night before....won't happen. They will need me for some thing else, and I'll find out after I get there. I expcected to be at rest areas #3, but I was every where else except rest area #3 the entire day. One experienced freind says they always over book and over schedule, not sure who will show up. This is reasonable.

Second lesson: Dress for the weather of the eday of the event, not the day before the event. Day before was 85F and sunny. So, some of the net control people arrived in short sleeve, and short pants. The actual weather was rain and 60F, which really feels cold when you don't have a coat. With the wind, it's cold even if you do have a coat.

Dress for outdoors. Net control was held in a park shelter with no sides. The wind blew right through. The seated personnel at the picnic table were all cold, even the ones wearing coats. And I was cold also, waiting for assignment. I offered the propane heater that I had with me. Yes! Cheerfully accepted. I mentioned to take a large tarp, and rope it to the posts, as a wind break. No one had a tarp. One of the operators, her clip pad and paper kept blowing. I had a paper clip from another job, and used it to secure the papers. The Net Control needs a lot of office supplies things like paper clips. Lucky to have the one, it was much appreciated.

Third lesson: Paper maps are a good thing. Having the route directions printed out in text form is also essential. I used the paper map I brought, to locate when I was going to drop off a couple helmets.

For this event, my Baofeng handi talkie worked the repeater just fine. The sound quality at Net Control wasn't great, there were a couple times I was able to understand a caller when Net Control had to ask for a

repeat. My TX wasn't very clear, but no one else was clear. I suspect a bad connection at the repeater. Net control had to ask people to "say that again, many times today. This time, it's not just me.

Fourth lesson: Expect to have a lot of idle time, and then some thing to do. I waited an hour, and then got important run to make.

Fifth lesson: Being able to transport riders back to the finish line is a plus. A couple times, they needed transport. I had planned to clear my front seat, but did not. I will for the next one.

Sixth lesson: Staying fed, watered, and use of toilet is important. The base camp had food (in another park shelter, about 100 yards away from net control, and it rained all day). I used the travel time to quick visit retail stores for food and toilet needs, in between assignments.

The final assignment was to go to a rest stop for the riders. Meet with other radio operators. One fellow was totally pleased with the light bar on his truck. He could do revolving, or wig wags. I also thought it was neat.

Sixth lesson: Eat when you can. I took the moment to eat one of thier granola bars and drink glass of gatorade at their expense. I got to follow the riders back. Two places, the bike route was too narrow for vehicle, so I had to detour a couple blocks out. Fortunately, I knew the area fairly well.

When they went onto the canal trail, one of the women in the pack turned back. I opened my window, she kindly thanked me for being there for them. Quite all right. And then detour back to the net control shelter.

Sit around for another half hour or so. Some one walked over and asked if anyone had jumper cables. I do, and a few minutes later he's got the engine started. Another unscheduled good deed.

I'd gassed up the truck the night before. Today cost me about $20 in gas, which is much less than expected.

The goals for the day were to do some good, have some fun, use my radio equipment, and be part of a team. We accomplished all of these goals. I consider today a definite success.

More specifically, the TYT BCG-F8 charger. TYT is the brand. It is physically the same as the Baofeng charger for the UV-5R. The electronics inside is different (it works with 13.8 volts input where the Baofeng charger operates at 10 volts input).

What people have been missing is the intent of Phil's question. The important point isn't just that TYT is another brand of Chinese radios - - the critical point in response to Phil's question is that TYT makes a charger which is intended for their TH-F8 radio but which is 100% compatible with the BaoFeng UV5R family of radios while using better quality components, a better design, and better quality of assembly.

http://www.409shop.com/409shop_product.php?id=106604

The BaoFeng charger is meant to handle approximately 10vDC input, it runs hot at anything above that, and it shuts down at about 13v input. The TYT charger works fine with a 10vDC input but easily handles an input up to about 14.5 volts (perhaps more). One key difference is that the BaoFeng charger cannot be powered by an automotive electrical system with the car running, but the TYT charger can. Another key difference is that no one has ever reported getting a TYT charger that didn't work when it arrived - or that arrived with cold-soldered or unsoldered connections.

Sent: Saturday, September 12, 2015 5:26:07 PM
Subject: [baofeng_uv5r] Another volunteer event after report

Sept 12,2015.

I signed up to be a helper of some sort or other,
on a bicycle marathon. There were going to be 100,
62, and 30 mile routes.

First lesson: The assignment in the email from the
night before....won't happen. They will need me for
some thing else, and I'll find out after I get there.
I expcected to be at rest areas #3, but I was every
where else except rest area #3 the entire day. One
experienced freind says they always over book and
over schedule, not sure who will show up. This is
reasonable.

Second lesson: Dress for the weather of the eday of
the event, not the day before the event. Day before
was 85F and sunny. So, some of the net control
people arrived in short sleeve, and short pants.
The actual weather was rain and 60F, which really
feels cold when you don't have a coat. With the
wind, it's cold even if you do have a coat.

Dress for outdoors. Net control was held in a park
shelter with no sides. The wind blew right through.
The seated personnel at the picnic table were all
cold, even the ones wearing coats. And I was cold
also, waiting for assignment. I offered the propane
heater that I had with me. Yes! Cheerfully accepted.
I mentioned to take a large tarp, and rope it to
the posts, as a wind break. No one had a tarp. One
of the operators, her clip pad and paper kept blowing.
I had a paper clip from another job, and used it to
secure the papers. The Net Control needs a lot of
office supplies things like paper clips. Lucky to
have the one, it was much appreciated.

Third lesson: Paper maps are a good thing. Having the route directions printed out in text form is also essential. I used the paper map I brought, to locate when I was going to drop off a couple helmets.

For this event, my Baofeng handi talkie worked the repeater just fine. The sound quality at Net Control wasn't great, there were a couple times I was able to understand a caller when Net Control had to ask for a repeat. My TX wasn't very clear, but no one else was clear. I suspect a bad connection at the repeater. Net control had to ask people to "say that again, many times today. This time, it's not just me.

Fourth lesson: Expect to have a lot of idle time, and then some thing to do. I waited an hour, and then got important run to make.

Fifth lesson: Being able to transport riders back to the finish line is a plus. A couple times, they needed transport. I had planned to clear my front seat, but did not. I will for the next one.

Sixth lesson: Staying fed, watered, and use of toilet is important. The base camp had food (in another park shelter, about 100 yards away from net control, and it rained all day). I used the travel time to quick visit retail stores for food and toilet needs, in between assignments.

The final assignment was to go to a rest stop for the riders. Meet with other radio operators. One fellow was totally pleased with the light bar on his truck. He could do revolving, or wig wags. I also thought it was neat.

Sixth lesson: Eat when you can. I took the moment to eat one of thier granola bars and drink glass of gatorade at their expense. I got to follow the riders back. Two places, the bike route was too narrow for vehicle, so I had to detour a couple blocks out. Fortunately, I knew the area fairly well.

When they went onto the canal trail, one of the women in the pack turned back. I opened my window, she kindly thanked me for being there for them. Quite all right. And then detour back to the net control shelter.

Sit around for another half hour or so. Some one walked over and asked if anyone had jumper cables. I do, and a few minutes later he's got the engine started. Another unscheduled good deed.

I'd gassed up the truck the night before. Today cost me about $20 in gas, which is much less than expected.

The goals for the day were to do some good, have some fun, use my radio equipment, and be part of a team. We accomplished all of these goals. I consider today a definite success.

Christopher! The best thing to do us jump in and become the Organizer's Assistant, you see the things that need to be planned for and then make it happen! It is OK
To be NET control, but better to make things run smoothly for the team and the event. That way you would be KP1SVR (Prob Solver)

Of course, Scott, but you did not submit an application -- Manuel DID submit and application (which was processed and a license issued) but claims that he did not pay the fee. The record for his GMRS license clearly shows that he was not covered by any of the exemptions for the application fee. When you get to the point where you chose not to submit your application, clearly he did submit his -- the next screen (which you did not reach) offers several options for how you want to pay the fee, including paying online with a credit card at a different US govt website, or printing out the Fee Remittance form 159 and mailing it in with your check or money order -- and includes the caution that the fee must be received within 10 days (I don't recall if that is working days or calendar days) or the application is invalid. If Manuel didn't pay the application fee, his brand new license is going to magically disappear in about two weeks, at which point he will receive a very interesting letter from the FCC asking him to explain his failure to pay the fee that he "signed" saying he was paying.

Christopher,
Thank you SO much for sharing your experiences. All of your lessons are very valuable, and worth saving. I hope that I can one day be as helpful as you were at some event. Volunteer working an event like that seems to be a very good way to use your Amateur Radio skills. I just got my first Baofeng UV-5R transceiver, and I'm still learning how to use it. Thanks again for your post.

Date: 2015-09-13 17:23:17 UTC
From: Phil
Topic: 52504 Message: 52609

Thank you and everyone else who answered very much,
It sounds like this is the charger to get as it would allow me to safely connect it to the "Station Battery" (360Amp/hr at 13.6 V on float charge 24/7). Nearly all the radio equip here runs on the station battery.

If you have more than one radio you also can get the 6-way charger bases that take up to 15 vdc input and will charge 6 batteries at once. These are what I use.

I run mine on solar, car socket or a trailer battery bank for my comms unit.

I use both uv82 and uv5R 6-ways.

For single use camping or limited space charging I use the TYT kits.

There is a test.
The test is to get an FRN and apply
for a GMRS license. You have to
follow the directions and pay your
$65 fee. If you pass, the Uncle givesyou a callsign.
BTW, if you use the Laurel VEC, you
can take amateur tests for free. Anamateur call is yours free for life.(unless you're a dummy and give $$
to W5YI - at least the ARRL tellsyou how to renew for free on the backof the form they send - it's missingon the W5YI renewal form)

The test required to get a GMRS license is filing the application and
coming up with $65.00.

You can file on-line by using the ULS system:
http://wireless.fcc.gov/uls/index.htm?job=home

You can file manually by downloading form FCC 605: https://www.fcc.gov/forms

Hi Tommy:

That would be -any- amateur license test. In fact, for any VEC administered amateur test sitting, you are entitled to take as many exam elements as you want. Even if you just want a Tech license, you should try the General test, and who knows, you might get lucky and pass. Same for the Extra.

I think the Laurel reference is to a club in Laurel, MD.

I just took my tech test yesterday in Albany OR which if I read my passing paper
their part of the Los Angles VEC
They only charged a $5 fee I assume it's all independent on the VEC's to fee or
no fee there was a guy who had just studied Friday night for his tech never
studied before passed with all 35 right decided to go for general and ended up
shelling out roughly 20 bucks and barely passed the last attempt he made.

The Laurel ARC is in Laurel, MD and hosts the

Laurel VEC, which has chapters in lots of places

http://www.laurelvec.com/ [http://www.laurelvec.com/]

The only other VEC that doesn't charge the

current $15 fee is in Alaska. Under current

rules, you can take as many tests for that $15,

unless you fail one and want a retest. Then

you have to pony up again. I would feel terrible

if a new applicant came in and failed twice.

They'd have nothing to show for it but empty pockets.

You're quite welcome.

That afternoon, I got home and found the bicycle valve adaptors (from Ebay) in my mailbox. Well, fat lot of good that did, after the event.

The net control guys did sent out an email after the event, they were pleased we all pitched in and did what was needed.

I'm guessing you'll be great as a volunteer. Talk loud, those BF have bad transmit audio.

Topic: 52625 Message: 52625
Attachments: 1 described; binary payloads are missing from this source WARC

My UV-5RE Plus just up and quit. When I turn it on all it does is display the top line of the LCD screen with everything lit up and it stays that way (see attached photo). None of the buttons do anything not even beep. I've tried reprogramming it with the computer but the computer won't read the radio. I read a few things about doing the factory reset by holding down a button while turning the radio on, I tried all the buttons and nothing. The displays never changes. Its become a brick. Does anyone have any ideas.

52626. Receiving in 118mHz in UV-5RA

Hi,

I'm using the latest version of CHIRP to change range of VHF frequencies in the UV-5RA to listen air traffic around 118.000mHz. I'm able to tune to 118.500 for example but looks like it's not receiving anything.

Does anyone had success doing that in the UV-5RA?

I saw that there's an old post about a file to change in library.zip in CHIRP folder, but apparently the new version don't have this zip.

Your Baofeng already will scan that and UHF, although poorly. Most Radio Shack, Uniden, etc will cover AM Air, 700, 800, and a lot of other bands, with better options. The Yaesu FT-60 can listen in on a lot of different bands, including AM Air, but costs $150.00, which probably leaves most Boafeng users out.

Problem with GMRS is if you have repeaters that are open in your area. Not too many as most put their $ and effort into Ham stuff. You might not have a single GMRS repeater in your area to use.

So you’re stuck with simplex only- real GMRS radios (5W versions) cost much more than an Uv5R too. They tell you to get your license if you buy the bubblepack radios from Wal-Mart but these are not the radios you want if you have a GMRS license.

The only real advantage to the GMRS license is that it allows the whole family to use the radios under that license.

A better option would be to think about a real Ham license, the Tech exam is really insulting easy and even has all the potential questions posted online. $15 for the license will be offest by the +$200 you will be spending for a certified Part 95 radio

But But I have to actual study.. and pay gas money to go to the exam center.

Can you pick me up, teach me all the correct answers and then take me to the exam center?

Also if you sell Baofeng's I will buy one off you at $19 each (with you programming them for me + extra battery) because that was the lowest price ever recorded at Amazon.com

BTW I want the 8W HP version too and antenna upgrade. Maybe a free speaker mic and for you to spend 1-5 hrs plus explaining every single button on the radio along with radio theory.

There is a test.

The test is to get an FRN and apply

for a GMRS license. You have to

follow the directions and pay your

$65 fee. If you pass, the Uncle gives
you a callsign.

BTW, if you use the Laurel VEC, you

can take amateur tests for free. An
amateur call is yours free for life.
(unless you're a dummy an d give $$

to W5YI - at least the ARRL tells
you how to renew for free on the back
of the form they send - it's missing
on the W5YI renewal form)

No not really, but they all come with those bands anyway. All you will get if you could find a 1970-80’s scanner that just did these bands, would be Ham radio, railroads, 150 segment police/fire and forestry.

Best bet is to get a digital trunking scanner like the Radio Shack Pro-107. Mine was stolen off my table a few shows ago (most likely from gang members that were really interested in it) I left to go to the bathroom and someone that was supposed to watch the table didn’t.

It cost me $399 a few years back, I got a used one off Ebay for $170 to replace it, so the prices have come down.

Would you reccomend a FM scanner that does, say, 144 to 173 MHz?

As far as I know there is no keypad power up sequence to do a reset. You have to use Menu 39 or 40 and that doesn't reset everything. Did you try to load a known good image into it with Chirp?

Probably the flash memory got corrupted or the microprocessor failed. It could also be something else.

Back when I worked on microprocessor based electronic devices we often got them in for repair with dead LCD displays or strange stuff showing up on the displays. Often reloading the firmware and software would fix it but that isn't possible with Baofeng radios.

You can set the UV-5R family of radios to display any NUMBER you want in the window -- but that does not make the chip capable of tuning those frequencies and does not make the radio magically able to receive AM.

Hi,

I'm using the latest version of CHIRP to change range of VHF frequencies in the UV-5RA to listen air traffic around 118.000mHz. I'm able to tune to 118.500 for example but looks like it's not receiving anything.

Does anyone had success doing that in the UV-5RA?

I saw that there's an old post about a file to change in library.zip in CHIRP folder, but apparently the new version don't have this zip.

I have seen this prob with loose or lifted LCD ribbon connectors soldered to the board. It is possible a bad solder joint is a problem too. USE a magnifier and look real close at the pads where the display connects to the board.

Most likely if it is more complicated than a resolder job or as Tom mentioned, a reset/reprogramming, I would toss it.

Unless you just want to crack open first to look at it, then toss it.

At the ride Saturday, there were at least one amateur operator
who was on a bicycle. That's a great combination. I do own a
bicycle, but my range is about 0.0 miles, on a good day.

Not all sure why I keep it, but just in case. There used to be
auto repair shop about two miles away. I could leave my
vehicle there, bicycle home. And bike back to the shop
when the vehicle was ready.

Radio had been working fine on APRS at 144.390. Now I tried to enter frequency and with the last number the voice prompt says cancel and the display returns to all 0's. I reset ALL with no change.

Entering the sixth digit of any frequency cause the 'cancel prompt.

What do I do

Subject: Re: [baofeng_uv5r] UV5R Chargers

What people have been missing is the intent of Phil's question. The important point isn't just that TYT is another brand of Chinese radios - - the critical point in response to Phil's question is that TYT makes a charger which is intended for their TH-F8 radio but which is 100% compatible with the BaoFeng UV5R family of radios while using better quality components, a better design, and better quality of assembly.

http://www.409shop.com/409shop_product.php?id=106604
http://www.409shop.com/409shop_product.php?id=106604

The BaoFeng charger is meant to handle approximately 10vDC input, it runs hot at anything above that, and it shuts down at about 13v input. The TYT charger works fine with a 10vDC input but easily handles an input up to about 14.5 volts (perhaps more). One key difference is that the BaoFeng charger cannot be powered by an automotive electrical system with the car running, but the TYT charger can. Another key difference is that no one has ever reported getting a TYT charger that didn't work when it arrived - or that arrived with cold-soldered or unsoldered connections.

Is it legal for unlicensed operators to use an amateur repeater?

There just might be a way.
In Australia the 70 cm repeater inputs are in an LIPD band.
So anybody may transmit voice with CTCSS code on the input
of a 70 cm repeater with up to 25 mw ERP, and no license is needed to
listen to the output of the repeater.

What would be the ACMA's response to people exploiting that loophole?
What would be the response from licensed amateurs?

That is correct picture. As delivered it is powered from the mains via
a wall wart. But you can get a straight through (no voltage drop, no
regulation) power cord for the car and use it with this charger.

Set menu 1 (STEP) to a value compatible with the frequency that you want to enter. In this case, 2.5 KHz or 5.0 KHz.

Jim

I use my bike as often as possible.I go food shopping with it. Betweena backpack and the bike bag, I canbring back almost $30 in food.
It's a mile each way. I take my'5R and become bicycle mobile.
That's KB3JQQ/BM ;-)

From: "Christopher Young cayoung@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

At the ride Saturday, there were at least one amateur operator
who was on a bicycle. That's a great combination. I do own a
bicycle, but my range is about 0.0 miles, on a good day.

Not all sure why I keep it, but just in case. There used to be
auto repair shop about two miles away. I could leave my
vehicle there, bicycle home. And bike back to the shop
when the vehicle was ready.

About twenty or so years ago, a guy I knew took a CB mobile
and a couple six volt lantern batteries, and went mobile. Mobile
antenna clamped to his bike frame. Wish I'd taken a picture.

He sure had alot of fun with that. I had a mobile set in the
vehicle. Can't remember if we talked, but likely did.

He never did have a drivers license, but he covered a LOT
of miles on bicycle.

Each VEC is allowed to charge any (or no) fee, up to the current limit set by the FCC. However, if your story is accurate, the VEC involved would have been in violation of the rules. You can take as many elements as you want to at a single test session, but you only pay the one fee for the session. If the VEC was charging $5, then the guy who took Tech and General would have paid only $5 for both tests.

Subject: Re: [baofeng_uv5r] UV5R Chargers

What people have been missing is the intent of Phil's question. The important point isn't just that TYT is another brand of Chinese radios - - the critical point in response to Phil's question is that TYT makes a charger which is intended for their TH-F8 radio but which is 100% compatible with the BaoFeng UV5R family of radios while using better quality components, a better design, and better quality of assembly.

http://www.409shop.com/409shop_product.php?id=106604

The BaoFeng charger is meant to handle approximately 10vDC input, it runs hot at anything above that, and it shuts down at about 13v input. The TYT charger works fine with a 10vDC input but easily handles an input up to about 14.5 volts (perhaps more). One key difference is that the BaoFeng charger cannot be powered by an automotive electrical system with the car running, but the TYT charger can. Another key difference is that no one has ever reported getting a TYT charger that didn't work when it arrived - or that arrived with cold-soldered or unsoldered connections.

Subject: Re: [Bulk] RE: [baofeng_uv5r] CTCSS tone scan removed from BaoFeng radios

I don't think voice transmissions, with CTCSS or otherwise, by LIPDs are legal, so I would expect ACMA to act against anybody trying to use such modes.

Doesn’t seem to be any restriction on modes for LIPD devices (at least in the 433/434mhz segment – there are in other band segments). So presumably FM voice with CTCSS tones would not be unlawful. However it seems to me that to deliberately use a device with the intent of accessing an amateur repeater would be.

From: R Pryor MAEd CETsr
Topic: 52504 Message: 52673

You can use the TYT charger with the wall wort if you want to charge it using normal AC line power
1. Mark the wall wort for TYT USE ONLY- as some people with these chargers blew up their stock uv5R chargers by plugging them in the wrong bases. I painted them both yellow to prevent this

Remove the wall wort and use a generic car male accessory socket feed line and you can plug in directly to a car socket and run 12-13.8 vdc without the heat issues.

Use that same feed line <mentioned above> and plug it into a solar panel (regulated properly) and the base works well with high quality controlled panels of proper output current

I had to buy the component kits with both the AC wall wort and base together. As Xaun mentioned they generally do not come separate.

********* Kit info DIY***********

I made up backpacking kits/emergency kits using this charger –here is some ideas

1. TYT Base and TYT Wall wort
2. Feed cable from base plug to male car accessory
3 Feed cable using red/black wires and Anderson power poles- base end has proper socket end- other end terminated in Anderson power pole
4 Anderson power pole to Female car accessory socket
5 10 feet extension anderson power pole both ends
7 three way piggy back with all anderson power poles
8 battery charger red/black alligator clips (for car battery) to anderson power pole
9. Li-on charger (also tyt made) for 8.4 vdc output- this can be connected directly to a TYT stock battery or the side socket of a 3800 mah baofeng extended battery
10. An inline power pole digital current and voltage LCD meter
11. Instructions on various connections and pieces in Color and laminated
12 A military issue waterproof radio bag (most likely for earlier model PRC 117’s (not the 117G) to hold all the contents

With this setup you should never have a dead battery as long as you have a solar panel, AC power, or an external battery (car or other)

Some changes I made is to include a 6-way charger unit that can take a 15 vdc input, a bigger bag to hold it and a suitcase portable fold out solar panel that puts out 100W

The whole thing can be setup in the field as needed, I can run charging banks for at least 12 radios (2 – 6-way ports) 6amps on max 500ma load the panel (with a battery tank) puts out 5.5 Amps in sunlight. The battery tank takes up any additional current demands.

No heat issues or tripping.

Those are some ideas to run with.

Get rid of all of them and use the latest

LI FE PO

Shorai power sports batteries

A new pricey version of the li graphite types have come out that are supposed to be better than li Fe Po’s but seem too expensive and limited in selection.

Shorai is what we run in the back pack portable mobile radios and repeaters.

LFX36L3-BS12MSRP: $329.95
SHORAI LFX Lithium-Iron Powersports battery, 36Ah PbEq 12V eq, "L" polarity, Case Type 3 Length 6.55" Width 3.39" Height 6.10" Shorai Batteries require a charging system output of 13.1 Volts or higher at idle, and must not exceed 15.2 volts at maximum output.

Only weighs 5 lbs with a 36Ahr rating we double them up adding only 10lbs of extra weight and a 70 ahr rating

http://shoraipower.com/lfx36l3-bs12-p130

Of course too high price for the average Baofeng model only owner, but if you have mobiles these are great this ran a 2M SSB rig all night long during a field day- in the morning the solar banks charged up the batteries.

If you do a lot of riding looking into the QYT 8900 mini dual bander and a Shorai battery. Someone had a mountain bike kit that had components to attach the radio and battery combo to the bike. Then a RJ45 PTT cable is offered on ebay to use PTT and a headset as you ride.

25 watts vhf 20 watts UHF priced around $100

Subject: Re: [baofeng_uv5r] Another volunteer event after report

I use my bike as often as possible.
I go food shopping with it. Between
a backpack and the bike bag, I can
bring back almost $30 in food.

It's a mile each way. I take my
'5R and become bicycle mobile.

That's KB3JQQ/BM ;-)

From: "Christopher Young cayoung@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

At the ride Saturday, there were at least one amateur operator
who was on a bicycle. That's a great combination. I do own a
bicycle, but my range is about 0.0 miles, on a good day.
Not all sure why I keep it, but just in case. There used to be
auto repair shop about two miles away. I could leave my
vehicle there, bicycle home. And bike back to the shop
when the vehicle was ready.

If the ACMA inspectors come around just buy them a few cases of stubbies and some moonshine from your private stock.

Things would be “No worries Mate” very quickly.

A good ole Barry O’Grady story here...

Back in 1990 (just before Desert Shield) we ordered circuit board cleaning alcohol for the Cal Lab 2M station. With a typical supply screw up, I got in a Army Green 55-gal metal drum of pure ethyl alcohol.

Looking at the MSDS sheets it was 99.999% pure with the ,0001 being water traces.

We put a spigot on the drum and put it on a frame at the lab which sat at the very far corner highest point at the base where nobody ever showed up. Only people I saw were those dropping off and picking up- Fridays Test Equipment and the occasional Emu and Roo that would look inside the windows.

Word spread fast about our “secret drum” so one of the town heavy drinkers made a bet with me that he could drink a bottle faster than any American (Yank) so we took water bottles and filled them up with water and left one filled up with the circuit board cleaner.

Then went looking for him for a bet, 3 of us took him on the bet and drank the water bottles pretending it was PGA and making faces doing it. Low and behold this guy was going to lose the bet so drank 12 ounces of PGA in 30 seconds or so.

So we let him win, barely holding back our laughing for the practical joke. The guy looked like it was the most horrible crap he ever drank but in the typical Aussie male style, would not let anyone know this.

He also said “Not bad” but looked kinda of sick. So we then got worried and watched him for awhile , as we were in the outback desert areas. Finally he staggered around and basically fell over. Wondering if the red back spiders, or lizards would do something to him. We put him in our FJ40 Landcruiser We loaded him up and took him home , until he barfed most of it out and within a few hours back to normal.

You gotta love Australia.

Is it legal for unlicensed operators to use an amateur repeater?

There just might be a way.
In Australia the 70 cm repeater inputs are in an LIPD band.
So anybody may transmit voice with CTCSS code on the input
of a 70 cm repeater with up to 25 mw ERP, and no license is needed to
listen to the output of the repeater.

What would be the ACMA's response to people exploiting that loophole?
What would be the response from licensed amateurs?

I think I tested as one of the last groups to go to the FCC building for the GROL back in the 90’s. No answer books, or published question pools. You had to over-study to pass the GROL for your commercial license including the radar endorsement.

Chances are if you passed your GROL , you knew your stuff.

Now this license means basically nothing and the exam to take would be the NICET exam which comes in two parts. The first part is a 6-hour 4-year college level exam on Physics, Chem, Calculus/Maths

, The second exam is all the EE questions and specialty.

If someone has a Nicet cert they are the new benchmark group that you can most likely say they “know their stuff”"."

Too bad Ham radio/ARRL +FCC does not create a class above Extra that would strictly be designed to indicate the technical/maintenance/experimenter proficiency of the holder. Then give some special privileges on the experimental freqs including digital coders and Sat bands and higher end GHZ freqs. .These holders could design their own systems and push the envelope for some new ideas.

You could use the LF and SHF unused portions to experiment. Make the exam not just a paper shuffle too.

When you read some of the questions you see asked on this forum (over and over again), or many of the silly advice comments by "techs" that have been licensed a whopping 6 months it is easy to understand your comment, Dean. Since the FCC decided years ago to forgo actual testing and implemented an open book multiple choice exam, we have gained thousands of new license holders, but sadly the majority of them haven't grasped many of the fundamental basics of the hobby yet. We can only hope they will someday, as we all started somewhere. Until then, there's always HF ....

Just that the back thread was discussing a unit which ran off automotive voltages but the photo shows a wall wort power supply. That was my confusion. Jim explained it which as I understand is that the desk stand is what you are looking for combined with another power source like an automotive accessory cable connected to the desk stand. Then you have a desk stand with an input range up to 13.5VDC.

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote :

The charger comes with a wall wart -- which is EXACTLY AS IT IS DESCRIBED (although the wall wart you receive may not look exactly like the one shown in the picture)

I have no idea where your question comes from.

To: baofeng_uv5r@yahoogroups.com mailto:baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] UV5R Chargers

What people have been missing is the intent of Phil's question. The important point isn't just that TYT is another brand of Chinese radios - - the critical point in response to Phil's question is that TYT makes a charger which is intended for their TH-F8 radio but which is 100% compatible with the BaoFeng UV5R family of radios while using better quality components, a better design, and better quality of assembly.

http://www.409shop.com/409shop_product.php?id=106604
http://www.409shop.com/409shop_product.php?id=106604

The BaoFeng charger is meant to handle approximately 10vDC input, it runs hot at anything above that, and it shuts down at about 13v input. The TYT charger works fine with a 10vDC input but easily handles an input up to about 14.5 volts (perhaps more). One key difference is that the BaoFeng charger cannot be powered by an automotive electrical system with the car running, but the TYT charger can. Another key difference is that no one has ever reported getting a TYT charger that didn't work when it arrived - or that arrived with cold-soldered or unsoldered connections.

Many people confuse "retail" with street pricing, which are different.

As to why some folks pay more than others, that happens millions of times per day all over the world. Some folks just don't know the price differences, and some folks just don't care, but usually the merchant in question is offering something that justifies the price.

A bottle of water is "normally" around a dollar, but chill that same bottle of water and it's suddenly worth more (to some folks at least). Be the only supplier of water in the middle of the desert and you can name your price.

That rubber resistor works well when I'musing my Echolink node, KB3JQQ-L. It evenhits the 440 repeater on the TV tower 7
miles almost line of sight from me.

Rich,

The odds of "most" Baofeng owners using a LFX36L3-BS12 battery is approximately the odds of snow falling in Death Valley, CA on the 4th of July.

I'm curious, please ... how do you use the APRS digital sound on your FM
Baofeng radio?

Rather noisy isn't it, like the old dial-up modem sound with a burst
every minute or so.

Yes, Scott, if the repeater is high enough to be capable of hearing your Baofeng (with it's normal ruberized resistor antenna) you can carry on a conversation, just don't try using it for any normal simplex conversations over a mile or so and you'll be fine (unless you swap out the normal antenna).

Antennas do make a difference especially when one minimizes the
cable/connector/adapter loss on the way there ... "5W" is still 5W max.
though.

52696. Rubber Ducky Antennas

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-14 19:07:16 UTC
From: Lee
Topic: 52666 Message: 52696

What a lot of people don't realize is when you try to extend your range with a longer Rubber Ducky Antenna (One closer to 1/4 wave such as the 12 or 13 inch ones available), there is "The other half of the story." These antennas work against ground or the other half of the antenna. These radios are only a few inches long. (The other half is thus way too short.) Just adding a longer antenna does not git rid of the the whole problem using a short whip. That is why these longer antennas don't improve things as much as some might expect. If you would add a 19 inch piece of wire for 2 meters or a 9 inch piece of wire for UHF to a ground connection on the radio and then let the wire dangle downward when using one of these longer antennas, the outcome would be much better. The whip is only 1/2 the story. The other half is the mirror image. If the radio itself is not long enough to be the mirror image or return, then a wire of the appropriate length added will indeed improve results.
Lee, w0vt

Communicating over APRS does only take a modem - in this case I use:

www.mobilinkd.com/

APRSDroid generates a signal every 10 minutes if the channel is clear.

I do have the STEP set to 2.5 KHz. and the Band is set to the upper display band when I try to store a frequency.

Thanks,

52698. Sticky greasy rubber ducky antenna

My rubber ducky antenna has developed a sticky greasy coating and I tried grease remover and alcohol and acetone and other standard degreasers and all to no avail. Does anyone know why the rubber starts sweating this sticky stuff and does anyone have a sure fire method of restoring the non-stick surface? I have several antennas like this but other antennas are just fine (maybe I have not waited long enough for them to go bad). Solutions? (other than buying a new antenna)

Topic: 52650 Message: 52699

BAND is not upper or lower display it is VHF or UHF. Tap the [BAND] button to toggle between the two or directly select it using menu 33 [BAND].

On older radios you had to specifically select the correct band based on the frequency that you were going to enter. Whether you are using the top or bottom had nothing to do with it either, because the VFOs can be set to (A/B) VHF/VHF, VHF/UHF, UHF/VHF or UHF/UHF.

Jim

Baofengs are legal for ham, 144-148mhz and 420-450mhz and you need a ham radio license to transmit. Commercial, public safety, and business can use the radio, but the agency or business must be licensed. You must then get permission of the license holders to transmit. You can use your radio to listen without a license. The radio is good for FCC Part 90 and 97, GMRS, FRS, MURS, and CB are Part 95 and have certain requirements that the Boafengs exceed. Do not listen to others who might tell you it does not make a difference or you won't get caught. When you signed up for this group, the introduction pointed all of this out.

You can only take each element once in a session. If the guy passed the test for Tech and went on to pass the test for General in the same session there is no way he paid for more than one test unless the VEC screwed up (which is not impossible but I would bet that the story is wrong instead)

Each VEC is allowed to charge any (or no) fee, up to the current limit set by the FCC.

However, if your story is accurate, the VEC involved would have been in violation of the rules. You can take as many elements as you want to at a single test session, but you only pay the one fee for the session. If the VEC was charging $5, then the guy who took Tech and General would have paid only $5 for both tests.

> that would strictly be designed to indicate the technical/maintenance
> /experimenter proficiency of the holder.

The biggest problem is that ham radio is so broad that no one could ever agree on what proficiency was meaningful. All the arguments that were ever made against requiring CW would apply equally to any other niche of the hobby. Even within a 'narrow' category like "digital modes" no one would ever agree on what knowledge was really essential -- and if they did agree, whatever they chose would be obsolete by the time it got through the comment and review process.

> Then give some special privileges on the experimental freqs

People who have the knowledge (and the money) can do all that NOW with a regular ham license.

By upper display I meant the channel was pointing to the top display line or the VHF band which is confirmed in Menu 33. I tried switching to the UHF before entering a frequency of 144.390 or 470.625 and it 'Cancelled' both. Similarly, pointing to the VHF band it 'Cancel'ed 470.625. It went through all of the menu settings and tried to reset all to the configuration I had before it stopped working - still no luck.

I had my Advanced Class license for 25+ years and saw very little incentive
to upgrade to Extra since very little extra bandspace was offered then.
Now "if" the FCC had said 12, 17, 30 or 60m was available only to Extra
Class that "might" have been enough to get me to upgrade many years ago.
Of course, going from the General (today) to Extra seems like you have
plenty of additional bandspace for your license upgrade incentive.

Each VEC is allowed to charge any (or no) fee, up to the current limit set by the FCC.

However, if your story is accurate, the VEC involved would have been in violation of the rules. You can take as many elements as you want to at a single test session, but you only pay the one fee for the session. If the VEC was charging $5, then the guy who took Tech and General would have paid only $5 for both tests.

Ooops, sorry, I guess I quit paying close attention to the process lately -- yes, the FCC has changed the rules to allow you to retake an element (for an additional fee) if the VE team has another version of the element available.

This is a relatively new change - you used to have to wait at least a week between retests of the same element

From: mailto:baofeng_uv5r@yahoogroups.com

If you fail an element, you can pay to take it again as many times as you can afford, until you pass, or run out of time.

Jardy,
Don't forget you can also program in MURS frequencies without a license to use their simplex freqs and if needed a "private" convo tones can be pre arranged but anything else yea a license is needed!

You can't "point to" the VHF or UHF band -- the upper and lower display have NOTHING to do with the band

From: mailto:baofeng_uv5r@yahoogroups.com
Sent: Monday, September 14, 2015 20:30 PM
To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] Can't set frequency - cancel message.

By upper display I meant the channel was pointing to the top display line or the VHF band which is confirmed in Menu 33. I tried switching to the UHF before entering a frequency of 144.390 or 470.625 and it 'Cancelled' both. Similarly, pointing to the VHF band it 'Cancel'ed 470.625. It went through all of the menu settings and tried to reset all to the configuration I had before it stopped working - still no luck.

OK. I just needed to make sure. Some think the top display is VHF only and the bottom display is UHF only.

If it isn't an incompatible STEP and the BAND is set to VHF (and on newer radios STEP and BAND don't matter when keying a frequency into the VFO), then about the only other thing it could be is the band limits have been changed so that 144.390 is no longer within the band limits. I assume that you don't have a programming cable to verify this or we wouldn't be having this discussion in the first place.

My solution to remove the sticky, greasy coating would be to purchase another antenna just like it. The Baofeng A-5R Logo antenna (standard on most UV-5R variants and the much better Baofeng A-V85 antenna (standard on the UV-B5 and UV-82) are both available (and cheap) on eBay and other sources.

> Baofengs are legal for ham, 144-148mhz and 420-450mhz and you need a ham radio license to transmit. Commercial, public safety, and business can use the radio, but the agency or business must be licensed. You must then get permission of the license holders to transmit. You can use your radio to listen without a license. The radio is good for FCC Part 90 and 97, GMRS, FRS, MURS, and CB are Part 95 and have certain requirements that the Boafengs exceed. Do not listen to others who might tell you it does not make a difference or you won't get caught. When you signed up for this group, the introduction pointed all of this out.

Scott, Scott, Scott.... Don't you realize that the special version of MURS that is legal for only a few special individuals also comes with real "Private tones" that actually work the way that all the FRS user guides pretend they do.

From: mailto:baofeng_uv5r@yahoogroups.com

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] GMRS license

"Private tone"? They only keep YOU from
hearing others not using YOUR tone. The
communications are still FM and can be

heard by anybody using YOUR tone or none
at all (or hold your MON button).

From: "Brandon Lima bravo.lima5@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

Jardy,

Don't forget you can also program in MURS frequencies without a license to use their simplex freqs and if needed a "private" convo tones can be pre arranged but anything else yea a license is needed!

I'm not sure what your point is Scott, but yes, that's correct. What I was referring to was "incentive" to upgrade. "If" the FCC had given one (or more) of the WARC bands to Extra Class only, that probably would have given me the additional incentive to upgrade years earlier.

My dad thinks the same way, plus having the Advanced license means you need to actually know something back in the day too. At least you had to know CW.

When I retook my license exam,(Was into Ham radio as a kid but let it expire) I showed up at the testing center ready to take all 3 exams at once. They did not know someone was going to test for Extra so did not have a VE to test for this at the time. So took booth Tech and General- of course passed both then a few weeks later came back for their next exam and took Extra.

So went to Extra within 1 month. It is not hard at all, kids are doing the same thing as all the test pool questions can be memorized with a little effort.

Subject: Re: [baofeng_uv5r] GMRS license

I had my Advanced Class license for 25+ years and saw very little incentive to upgrade to Extra since very little extra bandspace was offered then. Now "if" the FCC had said 12, 17, 30 or 60m was available only to Extra Class that "might" have been enough to get me to upgrade many years ago. Of course, going from the General (today) to Extra seems like you have plenty of additional bandspace for your license upgrade incentive.

The biggest problem is that ham radio is so broad that no one could ever agree on what proficiency was meaningful. All the arguments that were ever made against requiring CW would apply equally to any other niche of the hobby. Even within a 'narrow' category like "digital modes" no one would ever agree on what knowledge was really essential -- and if they did agree, whatever they chose would be obsolete by the time it got through the comment and review process.

People who have the knowledge (and the money) can do all that NOW with a regular ham license.

Mine's a 2x2 :) And even if I upgraded from advanced (which I doubt) I don't think I'd change it. Yeah, it's a bit long for CW, but has a nice ring to it when sent in that mode, though sometimes folks get all those dits mixed up. With my arthritic hands I haven't done CW in recent years anyway (other than listen to it when DXing NDBs my favorite listening hobby now).

52734. Re: [baofeng_uv5r] GMRS license

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-15 06:07:11 UTC
From: R Pryor MAEd CETsr
Topic: 52425 Message: 52734

I should get a vanity, mine is KK6CRP which all the KK series here as you know are tech class newbie calls. So I often get razzed a bit in tech chats as someone that “should not know anything>” A few would look up my call sign on HF thinking I am not allowed on those bands with that call sign. Oh well.

For field day though dropping a K would help, I figure that is the random number I should embrace as a call sign and at least the RP is my last initials.

Subject: Re: [baofeng_uv5r] GMRS license

Mine's a 2x2 :) And even if I upgraded from advanced (which I doubt) I don't think I'd change it. Yeah, it's a bit long for CW, but has a nice ring to it when sent in that mode, though sometimes folks get all those dits mixed up. With my arthritic hands I haven't done CW in recent years anyway (other than listen to it when DXing NDBs my favorite listening hobby now).

73 de Phil, KO6BB
http://www.qsl.net/ko6bb/ (Web Page)

PRESENT RADIOS:
Grundigs: S-350 (~2006), G6 (2011) & S450DLX (2014).
HOMEBREW: 7 Tube+Rect Regenerative RX for LF (built 2015)
Icom: R-75 With Cascaded 250 & 125Hz CW Filters. (~2005)
Icom: IC-7200 Transceiver (~2015).
Radio Shack: DX-380 digital portable (~1990).
Zenith: Royal-7000 Transoceanic Portable (~1968).

ACCESSORIES: HOMEBREW LF-MF Pre-Amp, MFJ-993B HF Auto-Tuner.
HOMEBREW 8 Hz Audio Filter.

ANTENNAS: 88 foot Long Ladder-line fed dipole at 35 feet AGL for MW/SW.
HOMEBREW Active Mini-Whip at 36 Feet AGL for LF/MW/SW.
HOMEBREW 37 foot "Low Noise Vertical" at 11 feet AGL for LF/MW/SW.

Merced, Central California, 37, 18, 37N 120, 30, 6W CM97rh

Well, it looks like K6CRP is available if you want it.

Please don't re-post huge amounts of info in your replies - the last two postings had whole digests included in the reply - one a request for unsubscribe and one a response letting the poster know about the unsubscribe link . In digest mode this means having to scroll the 20 to 30 screens to get to the end of the post so to be able to read the next post..

Thanks all.

Graham,
ZL3TV

Thanks for the info Jardy I was not fully aware of that as before I took my tech exam recently we have been having a big issue over the summer with people trying to break into various apartments here so several of us had picked up these radios as per suggestion of one of our local officers and had been communicating back and forth with the officer and others taking shifts trying to catch the dingle berries that were being stupid...thanks for mentioning that I will pass it on and make sure the others are aware of it we really haven't used them since the people caught on to what we were doing and moved on which inspired me to get my ham tech anyways.
Thanks again for the info best wishes!

The other thing most a lot of people do not realize, is even for legal use, a licensed ham operator can only use the radios in a certain range of frequencies. A licensed business or public safety agencies can only use the few frequencies they are licensed for, not the entire range of the radio. There is no legal unlicensed use of these radios in the U.S.

52743. RE: [baofeng_uv5r] Finally.... My UV5R is working!

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-15 09:30:27 UTC
From: Geoff
Topic: 52678 Message: 52743

I drove to Kadina today, about 100km from home, repeater on The Bluff about 7nm from home in opposite direction. Was still getting it with the BaoFeng and its ‘rubber resistor’ just laying on the dash about 7 clicks short of Kadina. Not bad.

Subject: Re: [baofeng_uv5r] Finally.... My UV5R is working!

That rubber resistor works well when I'm

using my Echolink node, KB3JQQ-L. It even

hits the 440 repeater on the TV tower 7

miles almost line of sight from me.

From: "Craig Carnahan craig.n7lb@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

Yes, it's well known that the normal stock 5" (or so) Baofeng antenna is a rubberized resistor.

Well, I thought so, but the rules don’t say they have to be type approved near as I can see, just that they have to meet some particular standards.

There’s a swag of docs about it, but a quick glance suggests they need to meet the standard but nothing about a process for type approval, which seems odd but I guess it’s possible.

Subject: Re: [Bulk] RE: [baofeng_uv5r] CTCSS tone scan removed from BaoFeng radios

I don't think voice transmissions, with CTCSS or otherwise, by LIPDs are legal, so I would expect ACMA to act against anybody trying to use such modes.

Doesn’t seem to be any restriction on modes for LIPD devices (at least in the 433/434mhz segment – there are in other band segments). So presumably FM voice with CTCSS tones would not be unlawful. However it seems to me that to deliberately use a device with the intent of accessing an amateur repeater would be.

Date: 2015-09-15 10:48:57 UTC
From: Graham
Topic: 52733 Message: 52746

> Sometimes we don't see the entire digest.
>
> Jardy Dawson
> WA7JRD Ham Radio

Hi Jardy,

I don't quite understand what you have said? If you receive this groups' messages in digest mode, all the messages for the digest are in one email - you just scroll down page to read the rest of the messages in the digest. If you are reading messages in digest mode, and you hit the REPLY button for your email program, as it appears you are doing Jardy in this case, then the whole digest will be tagged to the end of your reply. If in digest mode one wants to reply to just one of the messages in the digest, at the end of EACH message in the digest are links to select how you want to reply - ie: "Reply to sender" - sends a pm to the sender only, "Reply to group" - sends your reply to the whole group ... as I have selected here, "Reply via web server" - takes you to the yahoo groups' web page and sets up a reply on-line for you. The last option, "All messages", also takes you to the group page and sets you up to reply to all messages in the digest conversation.

Not wanting to sound like a stuck record, but common netiquette is to remove all extraneous messages, headers, signatures etc and to leave sufficient text only from the message you are replying to, to carry the theme of the topic. My reply has only included the above very brief previous theme, but sometimes it helps to include some of the original posters' post. When on a mobile device, on slow dialup (which parts of the world still are on) or on limited bandwidth, trimming posts is much appreciated by those affected. No soapbox speech but some enlightening info for all. Sometimes in a hurry we all miss such things and then a few of us are not so net savvy - I know it took a while before I found my way round - still am :-)

73
Graham
ZL3TV
(In the boondocks, on 10 acres, in my bus - but thankfully after many years of the worst dialup ever - if I could even get a connection, I am now in the bliss of broadband. There is life after all!)

52747. Re: [baofeng_uv5r] Digest Number 3999

From: Christopher Young
Topic: 52733 Message: 52747

Of course, you just full quoted a digest of 14 messages. What a waste of bandwidth.

Opens up the question. Wonder if amateur radio is legal for use by citizens crime patrols? Ought to be, they do "pumpkin patrol" at some bridges and over pass on haloween night.

A check of the standards would be of some interest. Hopefully they do
not extend to voice transmissions.

> I had my Advanced Class license for 25+ years and saw very little incentive to upgrade to Extra since very little extra bandspace was offered then. Now "if" the FCC had said 12, 17, 30 or 60m was available only to Extra Class that "might" have been enough to get me to upgrade many years ago. Of course, going from the General (today) to Extra seems like you have plenty of additional bandspace for your license upgrade incentive.

From: Christopher Young
Topic: 52425 Message: 52752

Now, that would be interesting. Bunch of unlicensed
operators, having no clue what they are doing, and
all jamming the airwaves on haloween. "Hows my
signal?" and the endless calls for backup, by citizens
on patrol. Anyone seen the Police Academy movies?

"Roger that, Mrs. F." said Tackleberry.

Gives me the giggles, to consider it.

Well, it looks like K6CRP is available if you want it.

On Mon, Sep 14, 2015 at 11:07 PM, 'R Pryor MAEd CETsr' doopsnoop@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

I should get a vanity, mine is KK6CRP which all the KK series here as you know are tech class newbie calls. So I often get razzed a bit in tech chats as someone that “should not know anything>” A few would look up my call sign on HF thinking I am not allowed on those bands with that call sign. Oh well.

For field day though dropping a K would help, I figure that is the random number I should embrace as a call sign and at least the RP is my last initials.

Mine's a 2x2 :) And even if I upgraded from advanced (which I doubt) I

don't think I'd change it. Yeah, it's a bit long for CW, but has a nice
ring to it when sent in that mode, though sometimes folks get all those
dits mixed up. With my arthritic hands I haven't done CW in recent
years anyway (other than listen to it when DXing NDBs my favorite
listening hobby now).

I get individual emails. New info is at the top. When I read the email, I scroll down far enough to see what the sender is responding too and stop scrolling. So I don't see if there is 6 more previous responses included. The sender needs to trim what they are sending.

On the other hand, some people do not include anything of what they are responding to, and it makes it difficult to figure out, especially if it has been awhile since the previous message came out.

52757. Re: [baofeng_uv5r] GMRS license

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-15 13:19:28 UTC
From: Jardy Dawson
Topic: 52425 Message: 52757

Yes, it should be legal as long as all operators are licensed and nobody is getting paid for it. A private security company working an event could not use ham radio, they would have to use a business license and whatever frequencies their company is licensed for. I work for a security company, but volunteer with Search and Rescue, the local Ham Radio club, and ARES/Races.

Jardy Dawson
WA7JRD Ham Radio

Message relayed through SETI (Search for Extra-Terrestrial Intelligence, although no terrestrial intelligence has been found yet, either)

From: Scott, KB3JQQ
Topic: 52733 Message: 52758

I call them random replies.
It's a snip of a conversationout of context and means nothing.

From: "Jardy Dawson JARDY72@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

<!--#yiv3207058623 #yiv3207058623 .yiv3207058623ygrp-photo-title{clear:both;font-size:smaller;height:15px;overflow:hidden;text-align:center;width:75px;}#yiv3207058623 div.yiv3207058623ygrp-photo{background-position:center;background-repeat:no-repeat;background-color:white;border:1px solid black;height:62px;width:62px;}#yiv3207058623 div.yiv3207058623photo-title a, #yiv3207058623 div.yiv3207058623photo-title a:active, #yiv3207058623 div.yiv3207058623photo-title a:hover, #yiv3207058623 div.yiv3207058623photo-title a:visited {text-decoration:none;}#yiv3207058623 div.yiv3207058623attach-table div.yiv3207058623attach-row {clear:both;}#yiv3207058623 div.yiv3207058623attach-table div.yiv3207058623attach-row div {float:left;}#yiv3207058623 p {clear:both;padding:15px 0 3px 0;overflow:hidden;}#yiv3207058623 div.yiv3207058623ygrp-file {width:30px;}#yiv3207058623 div.yiv3207058623attach-table div.yiv3207058623attach-row div div a {text-decoration:none;}#yiv3207058623 div.yiv3207058623attach-table div.yiv3207058623attach-row div div span {font-weight:normal;}#yiv3207058623 div.yiv3207058623ygrp-file-title {font-weight:bold;}#yiv3207058623 -->

On the other hand, some people do not include anything of what they are responding to, and it makes it difficult to figure out, especially if it has been awhile since the previous message came out.

52760. Re: Battery types

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-15 14:00:46 UTC
From: cprendon@...
Topic: 52666 Message: 52760

Not sure what you are thinking of for a 70cm 1/4 wave counterpoise. For 2 meter 200cm/4=50cm=19.7". For 70cm/4=17.5cm=6.9". So 9 inches really doesn't fit as a 1/4 wave for anything common. That would be 1/4 wavelength for just under 1 meter.

Unless I am missing something here. Could have been a typo too.

I have tried 1/4 wave counterpoise (tiger tails) on both 2 meter and 70cm with partial and full 1/4 wave antennas (per band) on HT.s Nothing empirical, but I seem to get better results with 2 meter than 70cm. While I can notice a significant difference with distant repeaters with the 2 meter, I haven't noticed any with the same setup adjusted for band on 70cm. Not sure why. Of course most HTs have less TX power on UHF but still in a before and after comparison there should be something.

---In baofeng_uv5r@yahoogroups.com, <l@...> wrote :

What a lot of people don't realize is when you try to extend your range
with a longer Rubber Ducky Antenna (One closer to 1/4 wave such as the
12 or 13 inch ones available), there is "The other half of the story."
These antennas work against ground or the other half of the antenna.
These radios are only a few inches long. (The other half is thus way
too short.) Just adding a longer antenna does not git rid of the the
whole problem using a short whip. That is why these longer antennas
don't improve things as much as some might expect. If you would add a
19 inch piece of wire for 2 meters or a 9 inch piece of wire for UHF to
a ground connection on the radio and then let the wire dangle downward
when using one of these longer antennas, the outcome would be much
better. The whip is only 1/2 the story. The other half is the mirror
image. If the radio itself is not long enough to be the mirror image or
return, then a wire of the appropriate length added will indeed improve
results.

An incident happened in NJ a few years ago where some town officials "borrowed" some ham HTs from the OEM office and were using them for "city business". Wasn't until the "friendly candy company" contacted them did they finally knock it off. Heard that it sounded similar to the movie.

Flags- see that between guard towers at the beach and between ships
Whistle- I did see a TV show about people on an island, can't remember where, who communicate for a mile or so by whistling.

I read some time ago of licensed GMRS holders being able to 'lend' their license for search parties enabling them to use higher power and repeater access while serving but am not sure if it would still be authorized.

§ 95.143 Managing a GMRS system in an emergency.

(a) The stations in a GMRS system must cease transmitting when the station operator of any station on the same channel is communicating an emergency message (concerning the immediate protection of property or the safety of someone’s life).

(b) If necessary to communicate an emergency message from a station in a GMRS system, the licensee may permit:

(1) Anyone to be the station operator (see § 95.179); and

(2) The station operator to communicate the emergency message to any radio station.

Hi Jardy,

I don't quite understand what you have said?

Gordon, we don't see any of that. When we reply, on my computer, with Yahoo, it brings up a box with the message quoted, but when you click Reply button at the upper right it all disappears. At least it does for me.

Others yahoo may be working differently. I don't know why it is, but this is a common problem here, and on all of the yahoo groups I moderate.

52772. Purpose of Ham Radio? (Formerly a GMRS topic)

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-15 17:10:09 UTC
From: Andrew M
Topic: 52772 Message: 52772

I am not intending this to be a flaming question. I already have an answer.
I have noticed a similarity in comments in some of the GMRS and other
threads, not to be cryptic.

Question for the newer ops. What is the purpose of Amateur radio? How was
the "hobby" created or brought to fruition?
OK 2 questions. My apologies.

As a VE, I offer the following answer:
§ 97.1 Basis and purpose. The rules and regulations in this part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles: (a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications. (b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art. (c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communication and technical phases of the art. (d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts. (e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

Solar Power,
6 months out of each year my wife and I "boondock" in our 5th wheel camper out in the Arizona desert using only solar power for all of our electric needs.
I operate a 50 watt ham vhf/uhf rig, a 40 watt Low-band Red Cross radio, and a 50 watt VHF CAP radio 24/7 and for scheduled nets three times a day a 100 watt HF rig. As well as all the lights in the trailer, the computer, printer and entertainment radio, furnace and the refrigerator (stove and refer also use propane).
Again, all on Solar Power.
So yes, Solar Power is one good way to run a rig during a no-grid-power situation, especially the tiny rigs we talk about here. I would think that here a small 15 watt panel thru an appropriate regulator into a battery pack would moe than suffice for most operations using just a 5 watt handheld.
I have 4 panels on the roof providing up to 600 watts (under almost never existing perfect conditions) and they feed five 100 Amp/Hour AGM batteries in parallel thru an MPPT controller.
I carry a small (2Kw) generator along in case of an extended period of no sun but have not had to use it for two years now except for one time when I wanted to do a bit of minor arc welding.

The more obscure question and yes even more off topic (Baofeng) is why is it called "Ham" radio? I have seen many explanations, but there seems to be no authoritative story as to the origin of the name.

52789. Ham Radio

Likely an example of corporate wishful thinking, <https://en.wikipedia.org/wiki/Hammarlund> Hammarlund products were supposedly so preeminent in the pioneering era of radio that they became a part of the language of radio. As the story goes, early radio enthusiasts affectionately referred to Hammarlund products as "Ham" products, and called themselves "Ham" operators. <https://en.wikipedia.org/wiki/Etymology_of_ham_radio#cite_note-15> [15] In truth, Hammarlund was a minor and barely known company at the time "ham" started to be used.

Yes, that would allow a licensed GMRS operator to allow the rest of the SAR team to legally use the toy GMRS/FRS radios that they otherwise use illegally for an actual emergency message. Keep in mind, however, that it only applies to an actual emergency -- so the searcher reporting "Oh my god I found him" might qualify (assuming that additional assistance was immediately needed), but a searcher reporting "Nothing in this sector" would NOT.

1. "your computer" has nothing to do with it -- you are talking about Yahoo's totally asinine Webmail system.
2. If you are determined to use Yahoo's webmail system, it would probably be good for you to learn HOW to use it. When you click "Reply" yes, the message text disappears -- at that point you need to click where it says "Show message history" to see the quoted text that Yahoo's idiot programmers configured the system to automatically include in every reply.

> Others yahoo may be working differently.

Yahoo is Yahoo. Unfortunately 90% of the people actually using Yahoo online (webmail or the group website) have absolutely no clue how it does work. (This compares with less than 50% of the people using Yahoo Groups via a real email client being equally clueless.)

When I was first licensed (as a "Tech" so long ago that it later became a Tech Plus With Credit for the General class written test) I got one of the first N calls issued in the call district, and the batch of new calls from that FCC test session were THE first N calls issued in our area. Half the hams on the air were sure that there was no such callsign or that it was supposed to be WN (which would have been a Novice call back then)

Under the current rules, perfectly legal, assuming, of course, the each of the operators holds his/her own amateur radio license.

-----Original Message-----
From: Christopher Young cayoung@... [baofeng_uv5r]

Opens up the question. Wonder if amateur radio is legal for use by citizens crime patrols? Ought to be, they do "pumpkin patrol" at some bridges and over pass on haloween night.

A technical note here.
The term "licensed GMRS Operator" is kind of misleading. Its not the Operator that's licensed. Its the station that's licensed. The holder of the station license is the defacto "Chief Operator" as he is the one person responsible to see that all the rules pertaining to said license are followed. IN radio terms a licensed operator implys one who has passed a test on said radio operations to insure kmowledge of the regulations governing the tupr and class of station the license is for.

As to the "Ham" question. telegraph operators said we were "Ham Fisted" the way we tapped out code over radio waves. Early days of the hobby required Morse Code skills and a mandatory 2 years of Morse only before moving out of Novice class.

Scott, thanks, Good answer! However can you translate that into English? Maybe provide some historical note? I am not trying to trick or test you here. There is good reason this all came about. I don't know that I can effectively communicate this in a neutral tongue or slant.

The way I heard it was at a time when commercial and amateur radio operators shared frequencies, bad actors who thought they were good actors were referred to as hams (hamming it up). The term was given to amateur radio operators because they "thought they were as good as" the commercial operators, so the term was applied to us by the commercial operators. As with many derogatory names, the group being given that name embraced it and it became commonly used. Of course in those days everything was CW. Your explanation was the first I ever heard that one but anybody can post anything to Wikipedia and if wrong and no one corrects it, it stays. YMMV. Nothing says mine is correct either.

Incentive Licensing was the FCC's name for their notion of making more than one class of amateur license with different classes having different privileges. Prior to incentive licensing, there was simply an Amateur Radio Operator license.

Yes, there is. It's actually quite easy. Just do "select>select all" on the lengthy text and then drag the top "handle" to deselect what you want to keep. Then "delete" the remaining selected text.
If you're using the Mail app and not the web browser, you can select and copy just the text you want to keep before "Reply"-ing. Only that text will be quoted in your reply.

One of the reasons for Amateur Radio was its use in times of peril, natural or man made disasters. I remember decades ago, if their was a major news event, local news would go a ham radio operator and have him use his radio equipment to talk to other hams around the world to get first hand news of what is happening.

One of the repeater clubs I was a member of, used to hold weekly emergency sim nets to train people how you handle emergency traffic.

Before cell phones, there was autopatch.

All of the above are no longer relevant. Cell phones, satellites, and the combination of the two obsoleted this aspect of Amateur Radio. Even police use their cell phones to communicate with their precent then using their radios.

Having lived through a natural disaster, Super Storm Sandy, I didn’t even think about using my radios. While there were periods of time cell phones were useless, it was infrequent.

The main purpose of Amateur Radio, for me that is, is more for social reasons. you make friends. you chat, you have enjoyable conversations. its funny... just the other day I was out in the mobile, talking to a friend who casually mentioned a road with heavy traffic, which I avoided after he told me about it.

The license requirements helps keep most of the riff raff off the ham bands. You still have some bad eggs, but they are fewer then on the 11 meter band.

As far as the code requirement being dropped years ago. I have mixed feelings about it. I remember the ending to the movie Independence Day. They sent instructions on how to destroy the aliens via Morse Code. I believe for a General license, you needed to be able to do 15 words per minute. I am pretty sure the numbers went higher as you climbed higher class license. Perhaps they should have just made 5 wpm keep the knowledge alive. As a far of communication, its dead. But there can be times when this form of simple communication is useful.

One of the new avenues for Ham Radio operators to use is the Internet to communicate to other Ham Radio operators as a means to access repeaters across the world. I heard some people not like Echolink as a form of Amateur Radio communication.

I've heard a number of so called origins of the term 'ham', some consider it was a contraction of 'home amateur', but I'm not old enough to know for sure.

Some terminology (in the US at least – hamming is international but the Americans have some, ah, 'unique' terms that are not necessarily used elsewhere) 'Elmer' being one, not sure where that originated, but it suggests an 'older' person so presumably someone that was well known as a mentor of newly minted hams – of that name – is the model. Other terms come from the 'Rotten Radio' series written by the founder of the ARRL one Hiram Percy Maxim – believe 'Lid' for a poor operator – and 'Wouff Hong' for a mythical stabbing weapon used on them, originated from there.

Unlike the US I have to pay an annual fee for my license. Whilst the 'public service' model exists here – WICEN – The Wireless Institute Civil Emergency Network – a product of the Wireless Institute of Australia – our equivalent of the ARRL – it's rarely used, more in the cities if anywhere, for public events, but the wide availability of UHF CB means that organisers often go it alone with their own equipment that needs neither a license or a licensed operator.

It may interest you to know that 'traffic' (passing on third party messages) was actually strictly forbidden until relatively recently – the govt didn't want the PMG (PostMaster General's Dept) to have any free competition for telegrams and long distance calls probably. That's changed somewhat now of course.

Whilst we've gone with the 'no code' and 'multi choice' exam, there is no question that even getting a Novice license is THAT easy. The question pool is very large and the learning the questions approach will probably not work for you. If you study that many questions and know that answers you've pretty much got the knowledge you need anyway. There's also a separate Regulations exam and for all new amateurs, a practical test, where you have to demonstrate your ability to operate a radio and use correct procedure and deal with common interference related issues – you need to demonstrate winding a power line choke for instance – so it's non trivial. Higher classes are based purely on technical knowledge demonstrated by exam and the Standard and Advanced class exams are non trivial even though they are still multi choice. Code is of course still allowed, but it's no longer required or examined, yet many new hams still seem to try it. I do recall one such bloke mentioning to me that kids would flock around to watch someone sending or receiving code, all but ignoring other ops on voice or packet – something about it seems to fascinate them.

What hamming is about mostly – to me – is technical innovation and community involvement. Many recent new hams are from the ranks of UHF CB, to the extent the local radio and electronics group broadcast the Sunday WIA news on UHF CB as well as the 2m repeater.

Probably the simplest, however I will say that some of the digital modes designed for poor signal paths do better. Some of them will pull an intelligible message out a signal that’s pretty much lost in the noise to the human ear.

Ah, the Quartzfest hamfest. If you also have a 4WD, we've probably been on several of the infamous 4WD trips together during the event. I think last year's ride had around 40 vehicles in total. If you don't have a 4WD vehicle, there's normally plenty of room to tag along in another ham's vehicle to explore the local area. Frank (KB7IQ) normally leads the effort and scouts out a nice ride a few weeks ahead of time.

As I remember it;
5 WPM - Novice
13 WPM - General and Advanced
21 WPM - Extra

Never could get the 21 down and as was said before, the little increase of frequency wasn't much of an inventive. As far as Sandy goes, the cell in my area was spotty at best. But there were few functioning repeaters. Actually I heard none but I'm giving the benefit of doubt. HF was OK if you had power. The problem is in this "bean counter" society, if there's no good reason for you to exist, you shouldn't and with the dwindling use of amateur radio for emergency use, some fear that we may be eliminated and the spectrum put to other (profit making) uses. I've noticed an increased emphasis in emergency use in QST in the past few years. If Sandy was any measure, we didn't do so well in my area.

That use of solar sounds excellent. I'm in the north east, where it's more cloudy and less solar. Still, it's a very good source of power for when the electric grid is down.

Good to hear it's working for you.

Back in my day (1956), the Novice license was good for -one- year… non-renewable. So, I took the test for Technician class, to “keep” my callsign, and passed it. A year or so after that, I got my code speed up, and took the General test at the FCC office in NYC. And then a few years after that, I took the Advanced test in NYC also. It was only after retirement that I took the Extra test before a local VEC.

But it was never the case that a person had to climb every rung of the ladder. There are a few hams I knew who went directly to the General class license. I think most had morse experience in the military, so that part of the test was easy for them.

It could be argued that a "Nothing in this sector" report still concerns the safety of someone's life. When an incident occurs where a SAR team is deployed, that incident might well be classified an emergency. All *pertinent* radio communications during that incident then become "emergency communications".

The wording of 97.403 for Amateur Radio is "immediate safety of human life and immediate protection of property", but the wording of 95.143 for GMRS is "immediate protection of property or the safety of someone's life".

Not " the immediate safety of someone's life"

"immediate protection of property" (Priority = Immediate). "the safety of someone's life" (Priority = Urgent)

While it may not apply to Part 97, reporting "Nothing in this sector" could qualify as an emergency message under Part 95, quickly allowing resources to be directed elsewhere.

If you're looking for an unapproved, non-emergency message for comparison, "I'm missing the football game looking for this yokel" is NOT.
--
Roger WQHP866 KJ4AJP

****
 Xaun Loc wrote:
Yes, that would allow a licensed GMRS operator to allow the rest of the SAR team to legally use the toy GMRS/FRS radios that they otherwise use illegally for an actual emergency message. Keep in mind, however, that it only applies to an actual emergency -- so the searcher reporting "Oh my god I found him" might qualify (assuming that additional assistance was immediately needed), but a searcher reporting "Nothing in this sector" would NOT.

 ****
Roger WQHP866 wrote:

§ 95.143 Managing a GMRS system in an emergency.

(a) The stations in a GMRS system must cease transmitting when the station operator of any station on the same channel is communicating an emergency message (concerning the immediate protection of property or the safety of someone’s life).

(b) If necessary to communicate an emergency message from a station in a GMRS system, the licensee may permit:
(1) Anyone to be the station operator (see § 95.179); and
(2) The station operator to communicate the emergency message to any radio station.

 ****
Karen Russell wrote:

I read some time ago of licensed GMRS holders being able to 'lend' their license for search parties enabling them to use higher power and repeater access while serving but am not sure if it would still be authorized.

Amateur radio in an emergency is still have a valuable service. This is why the various Office of Emergency Agencies maintain RACES and ARES networks, volunteers (of which I am one) and drills with hospitals, law enforcement and various emergency services in the US. Current events in California prove this.

Reference the Butte fire in Calaveras County, California now covering 70,000+ acres and just today reaching only 40% containment. Cell and landline service was failing due to burnt lines and cell site overloads and losses. ARES was activated at the largest Red Cross shelter and became the only good source of emergency shelter info both from and within the fire area. Cal Fire of course handled press releases and global info, but for people seeking emergency shelter, trying to locate people and pets and so forth, the ARES Net Control was the only reliable source of communications. This included email and file transfers using digital as well. They were at about 2,000 feet covering the local area and across the San Joaquin Valley into the San Francisco area due to their altitude. The local AM broadcast station had a Ham station and could broadcast up to the minute shelter and evacuation information as well. This worked extremely well until normal services started coming back online, which is still in process.

Although there is little one can do with amateur radio during normal circumstances that cannot be done otherwise, during an emergency it is often responsible for saving lives today even with all the other tech we have.

Yes the USN and Coast Guard have ratings such as CTR and RM that had high requirements for CW work. All knew morse code at min level of 25WPM.

I think the CTR rating has changed and I am not sure about the USCG use of Morse at the present time.

For the maintenance side, in both above ET’s do the radio comm repair work in both Radar, Navigation and Comms. You will find quite a few Hams that do the repair work with former military backgrounds. However with the days of SMD and cheap Chinese toss outs, repair work is not done for the most part anymore.

SMD work is tedious and to do it correctly a good rework station is a must.

Amateur radio in an emergency is still have a valuable service. This is why the various Office of Emergency Agencies maintain RACES and ARES networks, volunteers (of which I am one) and drills with hospitals, law enforcement and various emergency services in the US. Current events in California prove this.

Reference the Butte fire in Calaveras County, California now covering 70,000+ acres and just today reaching only 40% containment. Cell and landline service was failing due to burnt lines and cell site overloads and losses. ARES was activated at the largest Red Cross shelter and became the only good source of emergency shelter info both from and within the fire area. Cal Fire of course handled press releases and global info, but for people seeking emergency shelter, trying to locate people and pets and so forth, the ARES Net Control was the only reliable source of communications. This included email and file transfers using digital as well. They were at about 2,000 feet covering the local area and across the San Joaquin Valley into the San Francisco area due to their altitude. The local AM broadcast station had a Ham station and could broadcast up to the minute shelter and evacuation information as well. This worked extremely well until normal services started coming back online, which is still in process.

Although there is little one can do with amateur radio during normal circumstances that cannot be done otherwise, during an emergency it is often responsible for saving lives today even with all the other tech we have.

---In baofeng_uv5r@yahoogroups.com, <wb2eqm@...> wrote :

One of the reasons for Amateur Radio was its use in times of peril, natural or man made disasters. I remember decades ago, if their was a major news event, local news would go a ham radio operator and have him use his radio equipment to talk to other hams around the world to get first hand news of what is happening.

One of the repeater clubs I was a member of, used to hold weekly emergency sim nets to train people how you handle emergency traffic.

Before cell phones, there was autopatch.

All of the above are no longer relevant. Cell phones, satellites, and the combination of the two obsoleted this aspect of Amateur Radio. Even police use their cell phones to communicate with their precent then using their radios.

Having lived through a natural disaster, Super Storm Sandy, I didn’t even think about using my radios. While there were periods of time cell phones were useless, it was infrequent.

The main purpose of Amateur Radio, for me that is, is more for social reasons. you make friends. you chat, you have enjoyable conversations. its funny... just the other day I was out in the mobile, talking to a friend who casually mentioned a road with heavy traffic, which I avoided after he told me about it.

The license requirements helps keep most of the riff raff off the ham bands. You still have some bad eggs, but they are fewer then on the 11 meter band.

As far as the code requirement being dropped years ago. I have mixed feelings about it. I remember the ending to the movie Independence Day. They sent instructions on how to destroy the aliens via Morse Code. I believe for a General license, you needed to be able to do 15 words per minute. I am pretty sure the numbers went higher as you climbed higher class license. Perhaps they should have just made 5 wpm keep the knowledge alive. As a far of communication, its dead. But there can be times when this form of simple communication is useful.

One of the new avenues for Ham Radio operators to use is the Internet to communicate to other Ham Radio operators as a means to access repeaters across the world. I heard some people not like Echolink as a form of Amateur Radio communication.

It really depends on several factors, among which are the local number of hams in your area, the number of local repeaters [and if they have power backup], and your abilities to communicate with what's going on around you.

A Tech Class license holder, for example, may have no idea of various 20, 40, or 75m emergency HF nets being operated in his area, and if his local repeater is out of service, incorrectly conclude that ham radio is of little help, particularly if his equipment consists of a 5W handheld radio and a rubber duck antenna [not very condusive to longer distance simplex communication]. Another ham in the same area with outdoor antennas and/or a higher class license may still be communicating with other hams nationwide.

Just like the jump from HF CB / UHF FRS to ham VHF/UHF communications can seem like from flying a kite to jumping into a Cessna, the jump from Tech to General class opens up another whole world of communication possibilities that [unfortunately] many Tech license holders never experience, which is why I always encourage the Techs to really work just a little bit more to get their General class license. It really changes your view of what ham radio can do [especially in a grid-down emergency situation].

And then there are Generals and Extras that never take advantage
of their licenses. I know several Extras that have never used an HF
radio, and got the license just for the bragging rights (locally they are
known as "Extra Lite"s.

They don't know what they are missing.

As a big fan of 40/75m, I would have to agree with you Mike. One of these days I'm going to string up some stuff for 160m as well, I've just never found the time (so far).

I have my General, but haven't turned on the HF rig in probably 8 months. My interests in ham radio are Search and Rescue, and local Ares/races communications that we don't need hf for. I am currently converting a short school bus into a comms rig. It has a Yaesu 8800 and 7800 for ham, a Powerwerx DB750X for public safety, 2 Yaesu 1500s for packet and APRS, an Alinco 220 rig, CB (27mhz), and Airband for looking for downed aircraft. It has a bunk, microwave, 12volt/120v cooler, and a generator. This is replacing a trailer mounted comm shelter I have had for 4 years. I have little or no interest in hf. This is one nice thing about the hobby, there is so much to choose from that there is something for almost anyone.

And a HUGE jump in expenses as well. Like from an HT w/mag mount for $200 to an HF rig with a vertical with ground plane for $1,500. Now there's a big reason that some Generals never make the jump from VHF/UHF to HF. ;-)

As far as third party traffic goes, the Communications Act of 1934 covers that in the US by allowing anybody to receive any signal as long as you don't make money from it and do not deliver it to the intended party before they get it through the normal channels (my paraphrasing). That kept the commecial interests happy at the time.

>I've heard a number of so called origins of the term 'ham', some consider it was a contraction of 'home amateur', but I'm not old enough to know for sure.
>
>Some terminology (in the US at least – hamming is international but the Americans have some, ah, 'unique' terms that are not necessarily used elsewhere) 'Elmer' being one, not sure where that originated, but it suggests an 'older' person so presumably someone that was well known as a mentor of newly minted hams – of that name – is the model. Other terms come from the 'Rotten Radio' series written by the founder of the ARRL one Hiram Percy Maxim – believe 'Lid' for a poor operator – and 'Wouff Hong' for a mythical stabbing weapon used on them, originated from there.
>
>
>
>Unlike the US I have to pay an annual fee for my license. Whilst the 'public service' model exists here – WICEN – The Wireless Institute Civil Emergency Network – a product of the Wireless Institute of Australia – our equivalent of the ARRL – it's rarely used, more in the cities if anywhere, for public events, but the wide availability of UHF CB means that organisers often go it alone with their own equipment that needs neither a license or a licensed operator.
>
>
>
>It may interest you to know that 'traffic' (passing on third party messages) was actually strictly forbidden until relatively recently – the govt didn't want the PMG (PostMaster General's Dept) to have any free competition for telegrams and long distance calls probably. That's changed somewhat now of course.
>
>
>
>Whilst we've gone with the 'no code' and 'multi choice' exam, there is no question that even getting a Novice license is THAT easy. The question pool is very large and the learning the questions approach will probably not work for you. If you study that many questions and know that answers you've pretty much got the knowledge you need anyway. There's also a separate Regulations exam and for all new amateurs, a practical test, where you have to demonstrate your ability to operate a radio and use correct procedure and deal with common interference related issues – you need to demonstrate winding a power line

choke for instance – so it’s non trivial. Higher classes are based purely on technical knowledge demonstrated by exam and the Standard and Advanced class exams are non trivial even though they are still multi choice. Code is of course still allowed, but it’s no longer required or examined, yet many new hams still seem to try it. I do recall one such bloke mentioning to me that kids would flock around to watch someone sending or receiving code, all but ignoring other ops on voice or packet – something about it seems to fascinate them.
>
>
>
>What hamming is about mostly – to me – is technical innovation and community involvement. Many recent new hams are from the ranks of UHF CB, to the extent the local radio and electronics group broadcast the Sunday WIA news on UHF CB as well as the 2m repeater.

I know some places around here the noisy HOA’s prevent anything from going up including a UHF antenna. So those Hams cannot fully get into big radios and big antennas due to housing and Home owners regs.

A simple dipole cannot be put up. Some Hams though use some ingenious methods to hide their stuff and get around these probs.

A Tech Class license holder, for example, may have no idea of various 20, 40, or 75m emergency HF nets being operated in his area, and if his local repeater is out of service, incorrectly conclude that ham radio is of little help, particularly if his equipment consists of a 5W handheld radio and a rubber duck ant enna [not very condusive to longer distance simplex communication]. Another ham in the same area with outdoor antennas and/or a higher class license may still be communicating with other hams nationwide.

Just like the jump from HF CB / UHF FRS to ham VHF/UHF communications can seem like from flying a kite to jumping into a Cessna, the jump from Tech to General class opens up another whole world of communication possibilities that [unfortunately] many Tech license holders never experience, which is why I always encourage the Techs to really work just a little bit more to get their General class license. It really changes your view of what ham radio can do [especially in a grid-down emergency situation].

There are other types of antennas that can be used without incurring the wrath of the HOAs, very fine wire, magnetic loops which work fine from inside, attic dipoles, load up the gutter or downspout, even mobile antennas. If that bill goes through (which everybody should be writing their representatives to support) antenna problems may go away. Unforch the HOAs are putting up a fight even though their "facts" are a bit screwed up.

And a HUGE jump in expenses as well. Like from an HT w/mag mount for $200 to an HF rig with a vertical with ground plane for $1,500. Now there's a big reason that some Generals never make the jump from VHF/UHF to HF. ;-) Never heard of E-Bay or your local hamfest? I've personally seen hundreds of HF rigs for sale over the past few years for far less than $1500.00. I bought an Icom 756Pro two years ago (like new) for $700, and that radio sings and dances just like many brand new rigs. Of course, if you "must" have new, I've sure a phone call to HRO, AES, GigaParts, etc. would easily solve your HF worries for less than $1500. As others have said, you can make your own dipole antenna for darn near next to nothing.

There are people in my case, I live in a hi-rise building. I never got into HF because of no way I can have a 20 meter plus antenna. Also the likelihood of knocking out hundreds of TV sets in one shot. Not sure if that last one is still true with Hidef tv.

(Formerly a GMRS topic) Wed Sep 16, 2015 4:39 am (PDT) . Posted by: "Rjtoegel" rjtoegel As I remember it; 5 WPM - Novice 13 WPM - General and Advanced 21 WPM - Extra Never could get the 21 down and as was said before, the little increase of frequency wasn't much of an inventive. As far as Sandy goes, the cell in my area was spotty at best. But there were few functioning repeaters. Actually I heard none but I'm giving the benefit of doubt. HF was OK if you had power. The problem is in this "bean counter" society, if there's no good reason for you to exist, you shouldn't and with the dwindling use of amateur radio for emergency use, some fear that we may be eliminated and the spectrum put to other (profit making) uses. I've noticed an increased emphasis in emergency use in QST in the past few years. If Sandy was any measure, we didn't do so well in my area. (Formerly a GMRS topic) Wed Sep 16, 2015 7:01 am (PDT) . Posted by: "Magic Jack" angi_ha There is still ARES/RACES teams I'm an EC and in times of disasters in the first 48 hrs sometimes longer just depends on when power and other communications can be restored we are still called on to do our job of helping communicate. We still have nets around here for training also. Like Hurricane Katrina they were using ham for 3 weeks some places more as in the swamps the only

communications was Ham radio. Like the Tornados that hit Oklahoma all communications were out they had mobile Cell on Wheels (we call them COW) with in 72 hrs after the initial disaster. The Mayflower/ Vilonia Tornado we had zero cell service and no power for the first 48 hrs and was active using Ham. Right after Sandy they used Ham for a good week or 2 till all power and cell service was restored. We are still there to meet a need in times of disasters and our Jobs won't go away the need will still be there. Posted by: "Brandon lima" bravo.lima5 Bruce, I remember growing up in the 80's and parts of the 90's with a scanner listening to amateur's spat out cw like crazy it was always intriguing to me, I had a old electronics kit that barely put out any power to it but I was messing with the cw part of it and apparently one of my neighbors close enough picked up the interference on their tv and recognized it. I had never sought after learning it when I was young but I do now my friends dad N7ATQ still has his general from when I believe it was mandatory 15wpm and hes offered to teach me so I'm going to take him up on that after I get my call issued. Some may see it as obsolete but I don't its still a form of communications and to me seems like a reliable way when all else fails. 73'sbrandon On Wednesday, September 16, 2015 6:27 AM, "jl_wilkerson@att.net jl_wilkerson@att.net [baofeng_uv5r]" wrote: The good, relevant, emergency communicators have been replaced by vest wearing flash light driving Whackers. All Messages (25) . Top ^ 1g Re: Purpose of Ham Radio? (Formerly a GMRS topic) Wed Sep 16, 2015 8:07 am (PDT) . Posted by: cecil_r3 Amateur radio in an emergency is still have a valuable service. This is why the various Office of Emergency Agencies maintain RACES and ARES networks, volunteers (of which I am one) and drills with hospitals, law enforcement and various emergency services in the US. Current events in California prove this. Reference the Butte fire in Calaveras County, California now covering 70,000+ acres and just today reaching only 40% containment. Cell and landline service was failing due to burnt lines and cell site overloads and losses. ARES was activated at the largest Red Cross shelter and became the only good source of emergency shelter info both from and within the fire area. Cal Fire of course handled press releases and global info, but for people seeking emergency shelter, trying to locate people and pets and so forth, the ARES Net Control was the only reliable source of communications. This included email and file transfers using digital as well. They were at about 2,000 feet covering the local area and across the San Joaquin Valley into the San Francisco area due to their altitude. The local AM broadcast station had a Ham station and could broadcast up to the minute shelter and evacuation information as well. This worked extremely well until normal services started coming back online, which is still in process. Although there is little one can do with amateur radio during normal circumstances that cannot be done otherwise, during an emergency it is often responsible for saving lives today even with all the other tech we have. ---In baofeng_uv5r@yahoogroups.com, wrote : One of the reasons for Amateur Radio was its use in times of peril, natural or man made disasters. I remember decades ago, if their was a major news event, local news would go a ham radio operator and have him use his radio equipment

to talk to other hams around the world to get first hand news of what is happening. One of the repeater clubs I was a member of, used to hold weekly emergency sim nets to train people how you handle emergency traffic. Before cell phones, there was autopatch. All of the above are no longer relevant. Cell phones, satellites, and the combination of the two obsoleted this aspect of Amateur Radio. Even police use their cell phones to communicate with their precent then using their radios. Having lived through a natural disaster, Super Storm Sandy, I didn’t even think about using my radios. While there were periods of time cell phones were useless, it was infrequent. The main purpose of Amateur Radio, for me that is, is more for social reasons. you make friends. you chat, you have enjoyable conversations. its funny... just the other day I was out in the mobile, talking to a friend who casually mentioned a road with heavy traffic, which I avoided after he told me about it. The license requirements helps keep most of the riff raff off the ham bands. You still have some bad eggs, but they are fewer then on the 11 meter band. As far as the code requirement being dropped years ago. I have mixed feelings about it. I remember the ending to the movie Independence Day. They sent instructions on how to destroy the aliens via Morse Code. I believe for a General license, you needed to be able to do 15 words per minute. I am pretty sure the numbers went higher as you climbed higher class license. Perhaps they should have just made 5 wpm keep the knowledge alive. As a far of communication, its dead. But there can be times when this form of simple communication is useful. One of the new avenues for Ham Radio operators to use is the Internet to communicate to other Ham Radio operators as a means to access repeaters across the world. I heard some people not like Echolink as a form of Amateur Radio communication. Bruce Reply to sender . Reply to group . Reply via Web Post . All Messages (25) . Top ^ 1h Re: Purpose of Ham Radio? (Formerly a GMRS topic) Wed Sep 16, 2015 10:19 am (PDT) . Posted by: "R Pryor MAEd CETsr" snoopy_doopy44883 Yes the USN and Coast Guard have ratings such as CTR and RM that had high requirements for CW work. All knew morse code at min level of 25WPM. I think the CTR rating has changed and I am not sure about the USCG use of Morse at the present time. For the maintenance side, in both above ET’s do the radio comm repair work in both Radar, Navigation and Comms. You will find quite a few Hams that do the repair work with former military backgrounds. However with the days of SMD and cheap Chinese toss outs, repair work is not done for the most part anymore. SMD work is tedious and to do it correctly a good rework station is a must. Agencies maintain RACES and ARES networks, volunteers (of which I am one) and drills with hospitals, law enforcement and various emergency services in the US. Current events in California prove this. Reference the Butte fire in Calaveras County, California now covering 70,000+ acres and just today reaching only 40% containment. Cell and landline service was failing due to burnt lines and cell site overloads and losses. ARES was activated at the largest Red Cross shelter and became the only good source of emergency shelter info both from and within the fire area. Cal Fire of course handled press releases and global info, but for people seeking emergency shelter, trying to locate people and pets and so forth, the ARES Net Control was the only reliable source of communications. This included email and file transfers using digital as well. They were at about 2,000 feet covering the local area and across the San Joaquin Valley into the San Francisco area due to their altitude. The local AM broadcast station had a Ham station and could broadcast up to the minute shelter and evacuation information as well. This worked extremely well until normal services started coming back online, which is still in process. Although there is little one can do with amateur radio during normal circumstances that cannot be done otherwise, during an emergency it is often responsible for saving lives today even with all the other tech we have. ---In baofeng_uv5r@yahoogroups.com, wrote : One of the reasons for Amateur Radio was its use in times of peril, natural or man made disasters. I remember decades ago, if their was a major news event, local news would go a ham radio operator and have him use his radio equipment to talk to other hams around the world to get first hand news of what is happening. One of the repeater clubs I was a member of, used to hold weekly emergency sim nets to train people how you handle emergency traffic. Before cell phones, there was autopatch. All of the above are no longer relevant. Cell phones, satellites, and the combination of the two obsoleted this aspect of Amateur Radio. Even police use their cell phones to communicate with their precent then using their radios. Having lived through a natural disaster, Super Storm Sandy, I didn’t even think about using my radios. While there were periods of time cell phones were useless, it was infrequent. The main purpose of Amateur Radio, for me that is, is more for social reasons. you make friends. you chat, you have enjoyable conversations. its funny... just the other day I was out in the mobile, talking to a friend who casually mentioned a road with heavy traffic, which I avoided after he told me about it. The license requirements helps keep most of the riff raff off the ham bands. You still have some bad eggs, but they are fewer then on the 11 meter band. As far as the code requirement being dropped years ago. I have mixed feelings about it. I remember the ending to the movie Independence Day. They sent instructions on how to destroy the aliens via Morse Code. I believe for a General license, you needed to be able to do 15 words per minute. I am pretty sure the numbers went higher as you climbed higher class license. Perhaps they should have just made 5 wpm keep the knowledge alive. As a far of communication, its dead. But there can be times when this form of simple communication is useful. One of the new avenues for Ham Radio operators to use is the Internet to communicate to other Ham Radio operators as a means to access repeaters across the world. I heard some people not like Echolink as a form of Amateur Radio communication. Bruce Reply to sender . Reply to group . Reply via Web Post . All Messages (25) . Top ^ 1j Re: Purpose of Ham Radio? (Formerly a GMRS topic) Wed Sep 16, 2015 1:43 pm (PDT) . Posted by: "Craig Carnahan" cdcarizona It really depends on several factors, among which are the local number of hams in your area, the number of local repeaters [and if they have power backup], and your abilities to communicate with what's going on around you. A Tech Class license holder, for example, may have no idea of various 20, 40, or 75m emergency HF nets being operated in his area, and if his local repeater is out of service, incorrectly conclude that ham radio is of little help, particularly if his equipment consists of a 5W handheld radio and a rubber duck antenna [not very condusive to longer distance simplex communication]. Another ham in the same area with outdoor antennas and/or a higher class license may still be

communicating with other hams nationwide. Just like the jump from HF CB / UHF FRS to ham VHF/UHF communications can seem like from flying a kite to jumping into a Cessna, the jump from Tech to General class opens up another whole world of communication possibilities that [unfortunately] many Tech license holders never experience, which is why I always encourage the Techs to really work just a little bit more to get their General class license. It really changes your view of what ham radio can do [especially in a grid-down emergency situation]. Posted by: "Roger Elmore" mambm2002 It could be argued that a "Nothing in this sector" report still concerns the safety of someone's life. When an incident occurs where a SAR team is deployed, that incident might well be classified an emergency. All *pertinent* radio communications during that incident then become "emergency communications";. The wording of 97.403 for Amateur Radio is "immediate safety of human life and immediate protection of property", but the wording of 95.143 for GMRS is "immediate protection of property or the safety of someone's life". _Not_ " the immediate safety of someone's life" "immediate protection of property" (Priority = Immediate). "the safety of someone's life" (Priority = Urgent) While it may not apply to Part 97, reporting "Nothing in this sector" could qualify as an emergency message under Part 95, quickly allowing resources to be directed elsewhere. If you're looking for an unapproved, non-emergency message for comparison, "I'm missing the football game looking for this yokel" is NOT. -- Roger WQHP866 KJ4AJP ********** Xaun Loc wrote: Yes, that would allow a licensed GMRS operator to allow the rest of the SAR team to legally use the toy GMRS/FRS radios that they otherwise use illegally for an actual emergency message. Keep in mind, however, that it only applies to an actual emergency -- so the searcher reporting "Oh my god I found him" might qualify (assuming that additional assistance was immediately needed), but a searcher reporting "Nothing in this sector" would NOT. ********** Roger WQHP866 wrote: § 95.143 Managing a GMRS system in an emergency. (a) The stations in a GMRS system must cease transmitting when the station operator of any station on the same channel is communicating an emergency message (concerning the immediate protection of property or the safety of someone’s life). (b) If

necessary to communicate an emergency message from a station in a GMRS system, the licensee may permit: (1) Anyone to be the station operator (see § 95.179); and (2) The station operator to communicate the emergency message to any radio station.
********** Karen Russell wrote: I read some time ago of licensed GMRS holders being able to 'lend' their license for search parties enabling them to use higher power and repeater access while serving but am not sure if it would still be authorized. I never got into HF because of no way I can have a 20 meter plus antenna. Also the likelihood of knocking out hundreds of TV sets in one shot. Not sure if that last one is still true with Hidef tv.

Wow. I'm not sure what you mean by 20 meter plus antenna, but let's assume you meant a multi-band antenna. First, with height comes the ability to be very clever using wire antennas. During some weekends in college with my roommate gone, I used to drape a home-made end-fed wire antenna out my dorm window at night (I was 7 floors up) and never had any complaints from anyone. Of course, I didn't run 1500 watts on SSB and I made sure to practice safe operating procedures, grounding, etc. A 20m wire antenna would have been even easier. Naturally everything was brought back inside before morning. As dating became more serious, somehow chasing HF stations at night took a back seat to chasing other interests.

Unless your fellow apartment dwellers have somehow managed to role back time and watch old style analog TV with rabbit ears AND you want to run 6m with loads of power, I seriously doubt normal HF operations would "knockout" anyone's TV today, as digital TV sets are standard, and most of them are fed their signals (or channels) through a closed cable system.

So, is it "possible" that due to lack of proper TV receiving equipment on their end your HF signal "could" maybe, somehow, someday cause an issue? Sure, but with proper installation (on your end) and keeping the power to QRP levels (I consider anything below 100 watts to be QRP my friends), the likelihood of you causing any TV issues today is next to zero.

In any case, I would never allow the interference possibility (however slight) to stop my enjoyment of ham radio. If issues are raised, you fix them, and more than likely no one will even know (or care) that your little box in the corner of your apartment allows you to work other stations all over the country or all over the world. You could always tell them you are helping with EMCOMM relief efforts from the multiple earthquakes today in Chile. Who knows, you might even get asked to show them how it works!

Actually, a lot of Generals are very happy getting used equipment and
putting up their own home made antennas.

As are Extras, be they real or "Lite".

The cost of HF equipment is a factor, particularly if you are not well off. Even old, used HF equipment can set you back (here) anything from $400 up. (FT101 et al) New stuff? Well into four figures. I have an ancient FT200 that’s a little temperamental I’m resuscitating – got it for $200 about six years ago with known issues. Not that much S/H HF gear kicking around Oz I’m afraid so it keeps the S/H price up.

Started out with a DX-40 and three "rocks".

25WPM later I upgraded to a DX-100 and threw away the key.

Drake Lines / Collins S-Lines / Contest grade Kenwoods and Yaesus

Now.....It's back to a DX-40 and an even older Messiner Signal Shifter.

(if you heard it on the air, you would understand the "shifter" part anyway.)

I'm struggling to get back to 20wpm with my old pencil and paper, but it's
not so much about the speed (or lack of), but the challange of the mode
and then throw in QRP and it's a greater smile when a contact exchange is
finished.

I've never met a "lite" Extra.... just hams.

Yes, to many $500 may as well be $1,500. Also add the antenna and it's various components and the cost goes up even more even if you home brew. Add to that a mobility handicap and you have to hire out pretty much any antenna installation (living at ground level rules out any drop wires). It can be quite a bit more than just an old timey rig...

Topic: 52772 Message: 52853

Yes my Rep sent all area Hams a letter he supports the Bill.

Hopefully, the prob will be solved. Most have used tricks for VHF/UHF and some bands in HF to hide their antennas.

There are other types of antennas that can be used without incurring the wrath of the HOAs, very fine wire, magnetic loops which work fine from inside, attic dipoles, load up the gutter or downspout, even mobile antennas. If that bill goes through (which everybody should be writing their representatives to support) antenna problems may go away. Unforch the HOAs are putting up a fight even though their "facts" are a bit screwed up.

Bob WA2EGP

They could always buy used gear and put up their own antenna.....oh, I'm sorry. You're talking about today's general.

Bob WA2EGP (ducking)

"cprendon@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:

And a HUGE jump in expenses as well. Like from an HT w/mag mount for $200 to an HF rig with a vertical with ground plane for $1,500. Now there's a big reason that some Generals never make the jump from VHF/UHF to HF. ;-)

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote :

It really depends on several factors, among which are the local number of hams in your area, the number of local repeaters [and if they have power backup], and your abilities to communicate with what's going on around you.

A Tech Class license holder, for example, may have no idea of various 20, 40, or 75m emergency HF nets being operated in his area, and if his local repeater is out of service, incorrectly conclude that ham radio is of little help, particularly if his equipment consists of a 5W handheld radio and a rubber duck ant enna [not very condusive to longer distance simplex communication]. Another ham in the same area with outdoor antennas and/or a higher class license may still be communicating with other hams nationwide.

Just like the jump from HF CB / UHF FRS to ham VHF/UHF communications can seem like from flying a kite to jumping into a Cessna, the jump from Tech to General class opens up another whole world of communication possibilities that [unfortunately] many Tech license holders never experience, which is why I always encourage the Techs to really work just a little bit more to get their General class license. It really changes your view of what ham radio can do [especially in a grid-down emergency situation].

The next hamfest you all go to, find the ARRL boothand have them print out and sign the letters to yourcongresscritters. They will hand deliver them. If yousend mail, it must be checked before it's forwarded to
the legislator. That takes time and slows down your letter.

HB1301/S1685 Thanks for taking a few minutes to do this.

And a HUGE jump in expenses as well. Like from an HT w/mag mount for $200 to an HF rig with a vertical with ground plane for $1,500. Now there's a big reason that some Generals never make the jump from VHF/UHF to HF. ;-)

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote :

It really depends on several factors, among which are the local number of hams in your area, the number of local repeaters [and if they have power backup], and your abilities to communicate with what's going on around you.

A Tech Class license holder, for example, may have no idea of various 20, 40, or 75m emergency HF nets being operated in his area, and if his local repeater is out of service, incorrectly conclude that ham radio is of little help, particularly if his equipment consists of a 5W handheld radio and a rubber duck ant enna [not very condusive to longer distance simplex communication]. Another ham in the same area with outdoor antennas and/or a higher class license may still be communicating with other hams nationwide.

Just like the jump from HF CB / UHF FRS to ham VHF/UHF communications can seem like from flying a kite to jumping into a Cessna, the jump from Tech to General class opens up another whole world of communication possibilities that [unfortunately] many Tech license holders never experience, which is why I always encourage the Techs to really work just a little bit more to get their General class license. It really changes your view of what ham radio can do [especially in a grid-down emergency situation].

Depends on things like; Do you have a balcony? How power do you intend to run? Mode? A screwdriver mobile anmtenna can work nicely from a balcony. A magnetic loop could work from inside. QRP or low power could avoid TV problems. Since everything is probably in UHF anyway, harmonics are less of a problem. If you don't affect your TV then you might be on safe ground. Borrow something try before you commit any cash. Won't know until you try.

No balcony. If I hung a wire antenna out my window, chances are very good it would go past a neighbors window too. For cable TV, I used to run a coax between windows. Now I just run the cable inside my apartment. Right now, operating HF just isnt in the picture for reasons other then cost of hardware.

Too bad. There are other options too. It can be done. I worked a CZ with a 6' wire from inside my house with an MFJ-9420 (20 watts SSB on 20 mtrs). I also used a 10 mtr dipole folded into a rombus in my room and never bothered the TV in the next room and that was the old days of channel 2 starting at 54 MHz. Well, I just wanted to encourage you to try.

Here it doesn’t matter if you’re a Vet or not. In Kalifornia some view the flag as offensive and Vets are second class citizens. This is true in some areas here which is really sad.

For those that don't have the ability to set up their own HF stations -

I highly recommend checking out remotehams (one word). Download the software from the site, find a station/node from the list that you like the look/feel of, and ask the sysop/owner for access. The interface is a realistic looking HF transceiver that you can tune through the bands and use. You get to transmit when given access by the owner. Do use the ATU when you tx. Some nodes are for club members only, but always a good idea to ask as some clubs will still let you use their HF remote station if you ask. Do go onto the forum and get a feel of how things are done while waiting for Tx privileges. If you find a node you like, and start using it on a regular basis, consider making a small donation ($5-10) to help fund the station. Most are just radios in a fellow hams shack. When you do go to use a station, always use the "May I tune the remote" button first. When you connect to a station you will see if anyone else is currently connected. There is a chat window also so you can message other users or the sysop. One only needs an average speed broadband connection and nothing flash as far as a computer. Technical requirements are listed in the faq section of the forum. All you need at your station is a simple computer headset with mic that plugs into your mic and headphones sockets on your computer, or its soundcard.

I occasionally use a fellow hams remote station at the top of the South Island (of NZ) to compare propagation with my own locality (half way down the South Island) I can also transmit from home and hear myself on his station to get an idea of my on air audio etc - with very short delay of course.

Hope this helps some.

73,
Graham
ZL3TV (good on QRZ)

From: sheridandp@...
Topic: 52650 Message: 52869

Okay, now I have a programming cable and installed CHIRP and the UV_5R_P3 software. After I download from the radio, CHIRP shows no menus under Settings. The UV_5R_P3 software shows that the frequency range for the radio has been reset to VHF 100 - 100.99750 and UHF range is essentially 0. Apparently I need a new image file for a BF-F8HP. However, my virus checker won't allow me to go to the KC9HI site.

What else can I do?

52871. Question on backlighting and frequency display

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-19 15:08:37 UTC
From: oldradiofan@...
Topic: 52871 Message: 52871

I have a couple question about the F8HP model. Is there a keyboard shortcut to make the backlighting come on? And, is there a keyboard shortcut that will toggle between name and frequency display? It would sure be nice to be able to do that.

Thanks in advance,
Chris

52872. Re: [baofeng_uv5r] Question on backlighting and frequency display

Is there a keyboard shortcut to make the backlighting come on?

Hit any key and the display will light up for a few seconds.

And, is there a keyboard shortcut that will toggle between name and frequency display?

No, there isn't. You'll need to go to the correct Menu and toggle between the Frequency setting and the Name setting and then save it to change what you are seeing.

You have already had the backlight question answered. However here is how I handle the name/freq display issue which I find works quite well. Simply configure one display (A or B) as Name and the other as Freq. They you can place the same channel in both and see both Name and Freq for that channel. Of course this only works in channel mode as in VFO there is no name.

Was listening in On some chatter. When all of a sudden my radio sounded somewhat scratchy and echoey. I was still able to hear the radio, but I had to listen in very low volume. If I had the volume up I wasn't able to hear anything. So I continued to listen in and about five minutes later the volume just went dead even though the volume was all the way up. When I would shake the radio the sound would return but go away really fast. Now when I turn on the radio there's no volume at all. PLEASE HELP ME

I did have some such issue but one step from working to dead condition.
i had replace the audio amplifier TDA2822 SMD
and the handy restored.
but before replacing i checked that when incoming signals are there the green light was ON
and also the power to chip TDA2822 was being enabled.

My experience might give a cue.
but replacement of chip
you need skill and caution no to damage the board.
all the best

I had this and found tapping the volume knob would restore the audio.

I figured it was dust, so removed the knob and sprayed the exposed shaft with plastics-safe contact cleaner. Disassembling the radio was not necessary as it provided no additional access to the volume mechanism.

I used a piece of foil to protect the rest of the radio from the contact cleaner, just in case, leaving only the volume opening exposed.

I haven't had the issue since.

These radios ARE fixable.

All it takes is 2-4 hours of "bench time" for an experienced technician with the proper tools and training and about $50 in parts. By the way, "bench time" for a qualified technician runs about $150-300 per hour.

These radios ARE fixable.

All it takes is 2-4 hours of "bench time" for an experienced technician with the proper tools and training and about $50 in parts. By the way, "bench time" for a qualified technician runs about $150-300 per hour.

From: mailto:baofeng_uv5r@yahoogroups.com

Basically it's not fixable?

"Basically it's not fixable?"

ANYTHING is fixable if you throw enough time and money at it. Now the question is, "is it economically fixable"? Considering that you can buy a new one for something like $30.00, unless it's something simple that you can fix yourself, the answer is no. . .

You get what you pay for:

Cheap Chinese radio with little to no quality control? $35.

Expensive radio, but well-built, good warranty, and quality control at the factory? $300+

These Chinese radios do function, and have a place in the Ham's tool bag as a backup radio, or as a second radio for monitoring different frequencies. But to have a very reliable, well-built radio, you have to spend some $$$.

In my experience, the Yaesu FT-60R is the cheapest of the excellent HT radios. Personally, though, my absolute favorite HT is my new Kenwood TH-F6A - extremely easy to program from the keypad, AND it can be used with many Baofeng accessories, such as the USB programming cable and external microphones and head sets.

Most likely try to clean it as others suggested and if that doesn’t work toss it for the latest version out there.

Amazon has a limited return time period. Most likely the seller unless recent purchase will not send you a new one. However, I have heard this same complaint from a few others that the radio died during Rx operation.

I will add that I am close to dumping selling them if QC starts to continue to be an issue. You will find the sellers of these that are based in the USA to be shrinking. Only a few are selling TP’’s 8W versions or other clones like the Zastone versions. Most are starting to stick with Anytone, Wouxun, and TYT for Chinese radios.

HRO avoids all Baofeng products here.

The best Baofeng radio that seems to hold up would be the Uv82.

Has anyone had any issues with the uv82 series?

52900. Re: [baofeng_uv5r] Re: Question on backlighting and frequency display

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-20 20:45:29 UTC
From: Craig Carnahan
Topic: 52871 Message: 52900

Of course you could also abbreviate your "named" frequencies if you have room (and it makes sense to you). For example, the Phoenix 146.640 repeater is PHX 664, the 146.820 repeater is PHX 682 on my display. Naturally with only 7 characters available on the UV-5R, you'll need to be creative, but as long as you understand what your looking at on the display that's really all that matters. Don't even think about trying to enter alpha characters with your keypad, as the Baofeng radios don't support that feature.

FT-60 not legal on GMRS, even if you do the mod. It is a great ham radio, very easy to program without a computer. If you want GMRS, stick to a legal radio, please.

Jardy Dawson

On my radios, on the frequencies I use all the time, I "name" them the frequency numbers, without the decimal. For frequencies I rarely use, I either use a location or a call sign with abbreviations like the suffix and first letter of city. You will soon get to know your main frequencies.

Of course you could also abbreviate your "named" frequencies if you have room (and it makes sense to you). For example, the Phoenix 146.640 repeater is PHX 664, the 146.820 repeater is PHX 682 on my display. Naturally with only 7 characters available on the UV-5R, you'll need to be creative, but as long as you understand what your looking at on the display that's really all that matters. Don't even think about trying to enter alpha characters with your keypad, as the Baofeng radios don't support that feature.

>
> You have already had the backlight question answered. However here is how I handle the name/freq display issue which I find works quite well. Simply configure one display (A or B) as Name and the other as Freq. They you can place the same channel in both and see both Name and Freq for that channel. Of course this only works in channel mode as in VFO there is no name.

What do I spray it with wd40. So I take the volume cap off and spray the knob part?

What is a legal radio? Maybe I'll just save my money and buy another crappy baofeng instead of the yaseu and talk on gmrs like I used to when I didn't have my licence . Only difference now I have my licence. Legal or not who's gonna know?

I will add that I am close to dumping selling them if QC starts to continue to be an issue. You will find the sellers of these that are based in the USA to be shrinking. Only a few are selling TP’’s 8W versions or other clones like the Zastone versions. Most are starting to stick with Anytone, Wouxun, and TYT for Chinese radios.

HRO avoids all Baofeng products here.

The best Baofeng radio that seems to hold up would be the Uv82.

Has anyone had any issues with the uv82 series?

You get what you pay for:

Cheap Chinese radio with little to no quality control? $35.

Expensive radio, but well-built, good warranty, and quality control at the factory? $300+

These Chinese radios do function, and have a place in the Ham's tool bag as a backup radio, or as a second radio for monitoring different frequencies. But to have a very reliable, well-built radio, you have to spend some $$$.

In my experience, the Yaesu FT-60R is the cheapest of the excellent HT radios. Personally, though, my absolute favorite HT is my new Kenwood TH-F6A - extremely easy to program from the keypad, AND it can be used with many Baofeng accessories, such as the USB programming cable and external microphones and head sets.

You do as you want, just do not encourage others to break the law, please. And certainly don't brag about it. There are plenty legal radios available, at Walmart, Target, etc, in the blister packs.

Besides, if you don't know how to clean the volume pot, you probably don't want to mod a $150.00 radio.

I will add that I am close to dumping selling them if QC starts to continue to be an issue. You will find the sellers of these that are based in the USA to be shrinking. Only a few are selling TP’’s 8W versions or other clones like the Zastone versions. Most are starting to stick with Anytone, Wouxun, and TYT for Chinese radios.
HRO avoids all Baofeng products here.
The best Baofeng radio that seems to hold up would be the Uv82.
Has anyone had any issues with the uv82 series?

You get what you pay for:

Cheap Chinese radio with little to no quality control? $35.
Expensive radio, but well-built, good warranty, and quality control at the factory? $300+
These Chinese radios do function, and have a place in the Ham's tool bag as a backup radio, or as a second radio for monitoring different frequencies. But to have a very reliable, well-built radio, you have to spend some $$$.
In my experience, the Yaesu FT-60R is the cheapest of the excellent HT radios. Personally, though, my absolute favorite HT is my new Kenwood TH-F6A - extremely easy to program from the keypad, AND it can be used with many Baofeng accessories, such as the USB programming cable and external microphones and head sets.

Ham isn't for old people plenty of youngins are using them and getting involved
I'm 33 and just passed my tech test last week and I'm looking forward to helping
to operate at a Boy Scout jamboree soon in October and helping them to learn
what little I've learned so far you get by far better range with communications
as a ham than gmrs considering a lot of gmrs repeaters if there are any are
usually private unless you know the owners and it's not commercial. Just my 2
cents

Not into the ham thing. That's for old people. The baofeng takes care of my
needs perfectly . With those cheap lil Walmart target radios you can't talk to
people like you can on a baofeng

It's pretty silly to modify a good ham rig so you can use it illegally on GMRS when you can buy legal GMRS radios for about 1/6th the price! I bought an excellent pair of name brand GMRS handies at Bass Pro Shop for $50 for the pair. They are two watt units, and do both GMRS and FRS (at low power). FCC has dropped the fee for GMRS license as I understand, it too, so it's just a matter of filing an application to get one.

If you had a ham license, you could use your Baofeng on the ham bands and the commercial Part 90 frequencies, if it's part 90 certificated, which I believe all or most of the Baofengs are. But, Part 90 radios are not Part 95 compliant.

If you can find contact cleaner, spraying that on the volume control might help.

One of the problems with the Chinese radios is that it would cost you more to send it back to China than you paid for the radio. They come over here in huge shipping containers just full of stuff. Sending back just one is not economical. There are Chinese radios with U.S. dealers who provide service on them. I believe Radio City in Mounds View, MN will repair Baofengs, but I'm pretty sure the cost will quickly exceed the price of the rig. They sell other brands on warranty.

GMRS still has a license fee of $65.00, I believe, they took away the filing fee. Any ham radio modified for out of band will work fine for the ham freqs they were designed for, and will listen fine on the out of band freqs, but generally transmit poorly on them, as they are not designed for that. The Boafengs and other full width radios, are designed to work in those ranges, but thtat still does not make Part 95 compliant. Seems eto me that anyone who actually got a GMRS license instead of not caring and using them anyway, has to care at least a little bit on following the rules.

I have 1 or 2 of all the Baofeng standard models and the UV82 is by far the least problematic. Solid feel, reliable and stable. It does have the firmware issue requiring you to only upload the correct version, but there are so few versions and changes are way far apart that is almost a non-issue.

AND it comes stock with the commercial type antenna A-V85 and a sturdy belt clip. The dual PTT is very nice too with pretty much real time dual watch. I really like it and they are still under $40 each from A-zon. I get about 40% failure rate from new UV5Rs from Azon and 0% for the UV82.

Yep, $30 (for the Baofeng) divided by six equals $37.74.

Must be modern math, I don't get it. Want to explain again?

Hey guys, If any of you risked doing this without asking, you might get the boot off the forum. So please forgive me for first having done so here. I just don't know where else to ask for a lot of help from a lot of people as my friend and I are a little desperate and I really don't want to have to pay for this all myself. This is not an advertisement and we are sincerely asking for a little help from the amateur community on this.

RE: Knuckles.... I really know this is way out of line for a radio forum but many of you have known me for a long time and I know a LOT of people through Fox Tango Intl. I'm asking this as a personal favor if you guys would help me out a bit on this as part of the amateur community if we could come together and help this friend of mine out. His dog has a clothing fetish and ate something he really should not have swallowed and we are afraid he is going to lose him, he was just a puppy (Albeit it looks big now) I'd really like to help him. Would you guys please consider doing this a personal favor for me and make a donation for my friend Craig Atkins. (We were asking for a DOLLAR) but apparently this GoFundMe site only allows us to put in $5 as a minimal. If you guys can spare the price of a Big Mac to help out. I'd be VERY GREATFUL.....If you follow through please make a note in the comment box where it came from in the comment line just put Fox Tango International and he will know it's from the Ham Radio Operators from Around the country. It would mean a great deal to Craig and I both.
Sincerely!

We need to get Knuckles this surgery ASAP if we can get this together for him.
Best Regards
Carol W4CLM Club Admin Fox Tango Intl.

PS: If you would also consider my keeping up the Fox Tango web site, domain and I pay yearly for the web provider and I really try not to ask for anything. If that means anything to you please consider a little help here in return, if you can. Thank YOU !!

"These radios ARE fixable. All it

takes is 2-4 hours of "bench time" for an

experienced technician with the proper tools and training and

about $50 in parts. By the way, "bench time" for a qualified

technician runs about $150-300 per hour."

"Basically it's not fixable?"

If the inexpensive Baofeng is broken, why not use it as a learning experience and attempt to repair it? Most of us got our Amateur
Licenses because we were interested in the hobby. The hobby as most of you know includes exploring radio theory and repairing our
own equipment when it needs it. The FCC allows us to do this usually without their oversight. This usually teaches us about the
equipment and gives us great pride in being able to take care of it. What has happened to this pride?

Ham radio is for old people? Tell that to the 7-year-old boy I know who got his tech license a couple months ago. I know a few teenagers who are also Hams - one has his General and is working on Extra. Ham radio appeals to some young people because of the newer modes of operation as well as newer technology being adapted fir Ham, such as Raspberry Pi.

Are a lot of Hams old? Sure. Is Ham radio a dying hobby and radio service? Certainly not.

Subject: Re: [baofeng_uv5r] Re: WHATS WRONG WITH MY BAOFENG??????

These radios ARE fixable.

All it takes is 2-4 hours of "bench time" for an experienced technician with the proper tools and training and about $50 in parts. By the way, "bench time" for a qualified technician runs about $150-300 per hour.

From: mailto:baofeng_uv5r@yahoogroups.com

Basically it's not fixable?

The FCC _REDUCED_ the fee for a GMRS license, from $85 to just $65

From: mailto:baofeng_uv5r@yahoogroups.com

It's pretty silly to modify a good ham rig so you can use it illegally on GMRS when you can buy legal GMRS radios for about 1/6th the price! I bought an excellent pair of name brand GMRS handies at Bass Pro Shop for $50 for the pair. They are two watt units, and do both GMRS and FRS (at low power). FCC has dropped the fee for GMRS license as I understand, it too, so it's just a matter of filing an application to get one.

Maybe, Chris, you ought to READ the messages you are replying to -- especially when you say things that make a fool of yourself. Note that he never said you could get a legal GMRS radio for 1/6th the price of a BaoFeng, but rather that you could get a legal GMRS radio for 1/6th the price of a "good ham rig" -- and if you had been able to READ the thread your chose to reply to, you would have seen that the thread had already suggested Yaesu and Kenwood HTs as good ham HTs as opposed to the cheap Chinese radios with poor design and no quality control

Yep, $30 (for the Baofeng) divided by six equals $37.74.

Must be modern math, I don't get it. Want to explain again?

Sad but true. I probably qualify for the ‘old’ part, being less than a year shy of sixty, however I started in radio and electronics by tinkering with an ancient Ferris valve based car radio (dual voltage 240v mains and 6v DC) complete with Oak asynchronous vibrator. Got it working too. (some twit had transposed a couple of the valves into the wrong sockets.)

I incline to agree about the home made clock. Anyone with technical savvy would have figured out that it was exactly that – a clock – in under a minute I would think. I remember a time when schoolteachers were actually smart enough to do this – a couple of my teachers in the 60s were hams or in some way interested in electronics – rarely meet any with technical skills these days.

The BaoFeng is affordable and in low signal density areas (like where I live) the lack of receiver selectivity is not an issue. It’s not a ‘back up’ radio, it’s my only working 2m/70cm rig because I’m on a very tight budget.

Hey, Donnie -- have you ever seen a "stick of C4"? Apparently you got your "bomb" training watching bad TV shows.

NOTHING in that case looked like "C4" or any other explosive. Nothing in that case looked like a bomb at all to anyone who has ever seen a real bomb. The only place bombs have pretty digital readouts is on TV and in really stupid movies where they need something to be counting down while the hero defuses the bomb at the last second (except of course James Bond who defuses the bomb with 007 seconds to spare)

Um, C4 (or PE4 if you are Commonwealth military or ex military) doesn't normally come as a stick but as a block. PE means 'Plastic Explosive' and it's like plasticine, so you can mould it around anything (makes a good cutting charge that way) and it requires a detonator, merely setting fire to it won't set it off.

Troops were known to use it to boil water in their hexi stoves when they ran out of hexamine tabs.

Just saying.

I have several of these little radios, including the HP version, UV-5RA, UV-5RE, UV-3R, UV-82 (both 2/70 & 2/220), UV5-RAX 2M/220). I also have a Yaesu, Wouxun, Allinco 2M, and a Kenwood HT.

Perhaps I've just been really lucky but I have yet to have any of these fail or arrive DOA.

The selectivity of the Baofeng receiver leaves something to be desired but I've used them for quite a while with positive results.

If one were to fail, I'd likely just replace it.

I like the UV-82 best out of all the ones I've tried.

Worst radio I ever had. (RX performance wise) Best radio I ever had. (Amount of use gained from it, at very low cost, plus it has rejuvenated the VHF and UHF bands round here, and been the subject of a couple of interesting "tech nights" at the local club).

So I love it to bits...Them, to be precise, I have three UV5Rs and a UV3R Plus.

I did have one DOA, in that it initially worked OK, but after being switched on for a few seconds, would decide to TX on its own.

The supplier changed it, (a UK based supplier) and no further problems.

Yep, Geoff, that's right. Excellent as a fuel, burns hotter than hexi and doesn't stink

Also great for removing end connectors from the track pins of tank tracks without wasting 10-20 minutes beating on it with a hammer.

Military grade C-4 is commonly packaged as the M112 demolition block. The demolition charge M112 is a rectangular block of Composition C-4 approximately 2 inches by 1.5 inches and 11 inches long, weighing 1.25 lb (0.57 kg).

Ham isn't for old people plenty of youngins are using them and getting involved I'm 33 and just passed my tech test last week and I'm looking forward to helping to operate at a Boy Scout jamboree soon in October and helping them to learn what little I've learned so far you get by far better range with communications as a ham than gmrs considering a lot of gmrs repeaters if there are any are usually private unless you know the owners and it's not commercial. Just my 2 cents

Not into the ham thing. That's for old people. The baofeng takes care of my needs perfectly . With those cheap lil Walmart target radios you can't talk to people like you can on a baofeng

BTW, a legal radio must be FCC Part 95 compliant. Get a ham license and you can use an FT-60 legally and have more fun and flexibility than on GMRS. Cheaper licenses, too.

You get what you pay for:

Cheap Chinese radio with little to no quality control? $35.
Expensive radio, but well-built, good warranty, and quality control at the factory? $300+
These Chinese radios do function, and have a place in the Ham's tool bag as a backup radio, or as a second radio for monitoring different frequencies. But to have a very reliable, well-built radio, you have to spend some $$$.
In my experience, the Yaesu FT-60R is the cheapest of the excellent HT radios. Personally, though, my absolute favorite HT is my new Kenwood TH-F6A - extremely easy to program from

the keypad, AND it can be used with many Baofeng accessories, such as the USB programming cable and external microphones and head sets.

Yea I was at a 20% failure rate for Uv5R’s and stopped buying them, switched to a better clone model but still have failure rates, just much lower though. No failure rate with the uv82 models at all.

I have 1 or 2 of all the Baofeng standard models and the UV82 is by far the least problematic. Solid feel, reliable and stable. It does have the firmware issue requiring you to only upload the correct version, but there are so few versions and changes are way far apart that is almost a non-issue.

AND it comes stock with the commercial type antenna A-V85 and a sturdy belt clip. The dual PTT is very nice too with pretty much real time dual watch. I really like it and they are still under $40 each from A-zon. I get about 40% failure rate from new UV5Rs from Azon and 0% for the UV82.

An Asian girl aged 13 came to the table looking at radios two weeks ago. Interesting kid, her father helped direct her into Ham radio at age 11. Forget her call sign, she mentioned other kids at her school are licensed too.

Of course if you cannot pass a basic literacy test or are too unmotivated to study for an exam of 34 questions and find that a $30 Baofeng is half the price of a license fee, you end up with a few excuses not to get licensed.

I've only had one technical issue with a UV-82 (so far), but the lack of an extended battery does cause many to skip it, which is really too bad. Otherwise, it's a really decent radio at that price point.

Hi Andy, yeah this is one post I can make without getting smart ass remarks! Licensed here at 12 yrs old, been through all the Classes, Novice 1 yr license, Tech 18 years, General 2 years, Advanced 2 yrs, and TRUE 20 wpm Extra! I teach classes as a Certified Instructor and VE, I I can tell you this NONE of my students would ask the questions I see here, and they operate radio like real Hams!
As for techies when their cell goes away they are lost, my students know how to get a round lost COMM issues, can design and built their own antennas, and repair their equipment under emergency conditions! Good students need good instructors in order to excel!

I wonder if Baofeng would private label a batch with "UV-5R POS"? So long as you purchased the MOQ, I'll bet they would and not even think twice about it.

UV5Rs. I have at present three of them. They are handy as "throw-away when they break" level handhelds for ham radio operations when working checkpoints, lead or sweep vehicle, or co-ordination at marathons, road races, and the like. I always carry a spare or two for when the first one breaks and at less then 25 bucks each (cheaper if bought in quantity).
They fill the bill and are cheaper than fixing any other radio at about $50 - 90 bucks and hour bench time plus parts.
Would I use one in a service for which it isn't approved (Like GMRS or FRS or any part 95 service) ?*** NO FLIPPING WAY ! *** I value my various federally held licenses (Amateur and Marine radio, FAA (aviation) pilot, Coast Guard license (skipper), firearms (Title 3), ICC driver, etc) far too much to give the federal government reason and good cause to take them away.
Common info -- The feds take one license for cause --- they seem to take them all "because of" (instead of "for") the same cause.
With the proper equipment these sets are far too detectable over the air as to what they are. And I have good reason to believe the FCC has said equipment. Now whether it is deployed in ALL their monitoring vehicles I have no idea, but I do know it is in at least one of their suburbans.....grin. And since the gear is relatively inexpensive I'd not be surprised to know it was in all.

WITH MY BAOFENG?????? I have 1 or 2 of all the Baofeng standard models and the UV82 is by far the least problematic. Solid feel, reliable and stable. It does have the firmware issue requiring you to only upload the correct version, but there are so few versions and changes are way far apart that is almost a non-issue.

AND it comes stock with the commercial type antenna A-V85 and a sturdy belt clip. The dual PTT is very nice too with pretty much real time dual watch. I really like it and they are still under $40 each from A-zon. I get about 40% failure rate from new UV5Rs from Azon and 0% for the UV82.

I knew I would be called out on the shape of whatever the kid had in
his "project".

I was using the generic description that I heard on several radio
stations, but my point ..... and you helped make it ... was that the
teacher probably didn't know C4 from poop. His/her responsibility was
to protect the classroom.

Unfortunately, kids have been suspended from school for less....
(making a "gun" out of a piece of cheese).

So as far as I'm concerned, The initial assessment was cautiously correct.
The administration of punishment after the facts were questionable.

Exactly correct!

I have no problem with the clueless English Teacher who started this mess.
My problems are with 1) What happened after the English Teacher saw the
device, and 2) with the sudden change in the stories about #1

The initial reports FROM THE SCHOOL AND THE POLICE were consistent and not
especially surprising:
1) The English Teacher saw an electronic device that she didn't understand
and over-reacted. Given the overall situation today, the over-reaction was
NOT UNREASONABLE...
2) The English Teacher reported the device to the Principal who also had no
idea what it was
3) Either the English Teacher or the Principal (the statements were not
clear on this) consulted with the Science Teacher who had already seen the
clock and who knew it was not a bomb or anything dangerous or prohibited.
4) The Principal called the cops
5) The cops who responded were just as clueless as the English Teacher and
the Principal (not really surprising)
6) The cops called in their explosives person who obviously would know what
they were looking at.
7) The police explosives expert agreed that it was not a bomb. In fact, the
police explosives expert never treated it as a bomb or potential explosive
device once he saw it.
8) The official statement by the Chief of Police made it clear that no crime
had been committed and that there was never any danger.

Given today's attitudes, none of this is surprising. People have been
conditioned to Always Over-React to anything they don't understand.
Somewhere across the US, someone calls the cops for a 'suspicious object'

nearly every day. None of this is unusual. Far less than 1% of the time, the police find either a real or fake explosive device -- in the vast majority of cases, there is minimal disruption while the police bring in someone who knows what they are looking at, followed by quick apologies on both sides and everyone goes back about their business. THAT is what should have happened here if the initial reports were true.

It seems likely that the kid was suspended primarily because the principal was mad because he felt he had embarrassed himself and the school by calling the cops for a device that his own science teacher knew was harmless. None of the original accounts provide any reason why the kid was handcuffed beyond a questionable over-reaction by the initially responding police officers.

Then 24-48 hours later, the story changed -- suddenly we see stories explaining that the kid was suspended for being uncooperative. THOSE stories cite only the school principal as a source and those stories surfaced only after there was criticism of the school for suspending a student who had not done anything wrong according to the school's original statements about what happened.

I don't personally know what happened. All I know is what the statements by the people involved all said happened. The original stories all agreed and none of those original statements indicated any justification for action against the student.

> Unfortunately, kids have been suspended from school for less....
> (making a "gun" out of a piece of cheese).

Yes, especially in the academic environment, we has institutionalized a policy of stupidity based on "Zero Tolerance" which is actually a buzz phrase for Zero Judgement and Zero Sense.

> So as far as I'm concerned, The initial assessment was cautiously correct.
> The administration of punishment after the facts were questionable.

We agree.

Who are these faceless committees that make these "zero-tolerance"
rules and remove any common sense from everyday situations ?

Five year olds getting suspended for kissing each other in pre-school ????

If I were KING, I'd fire everyone involved with a "zero-tolerance" policy.
School Boards need to find solutions... not create problems.

When growing up, I also went to a high school where guns were the norm...
It wasn't uncommon to see deer rifles and automatic shotguns in truck racks
or car trunks.

There were thirty or more shotguns in the homeroom corner for a school
sponsored crow hunt after corn harvesting. Thirty shotguns in a school
bus.

Not a single gun was discharged on or in school property.

We trusted each other when it came to gun safety. There was our share of
fist-fights but no one would have even thought of escalating conflicts
to the available fire-power in the parking lot.

I'll be going to a dove shoot this weekend with my son and two of my
grandsons.
I'm proud that they understand their responsibility around guns.

I feel sorry for all the inter-city kids that think a 9mm is their
ticket to adulthood.

It is because of political correctness and lawsuits. The old days of education are gone when we were kids. Notice MAED in my Email? Masters Degree in Education, I know how bad it can be.

I taught outside the USA due to the disgust I had with the present system. Suspension is minor, making kids take all kinds of drugs to settle them down without knowing the long term effects is basically criminal.

Not to sound like a conspiracy theorist, but I really think there is an effort to destroy this country from within going on right now.

Like him or hate him, I think all Americans should look at Trump. The reason I say this is I am at the stage I feel there is really no difference between the parties on policies that are just plain stupid.

However, the huge attack upon Trump from both sides indicate he might actually be someone that is not fully “Bought and Paid For.” When the news media, including Fox news constantly attacks him at every chance they get, you might want to wonder why?

He is a threat to the status quo, and a businessman with common sense, that is NOT politically correct to tackle the huge problems in this country just might be the right person at the right time for the job.

Love him or Hate him, he deserves serious looking at as a candidate or we will soon find what is left of America – is gone.

I have confidence that Trump will put the BEST people for the job in positions needed. Therefore, any shortcomings he might have will be negated by having the right people in the right places.

Anything is better the the last series of failures we have had running this country.

For me Trump brings some enthusiasm back, Hitlery Clinton and another Bush certainly do not. (Or the dunce Biden)

I am certain the education system will be looked at under a Trump admin.

THANK YOU Mick,
And I want to take this opportunity to thank EVERYONE who answered my questions when I bought my UV5R. Your made it 'much' easier to get it up and running.

And as a side note, for those who say that the range with the "rubber dummy load" is rather limited, I take my stock UV5R with me on my morning walks around the mobile home park. I have NO problem reliably getting into the WB6BXN repeater on Mt Bullion, perhaps 25 or more air miles away. Normally with full quieting, but some occasional momentary drop-outs as I walk between some of the mobile homes. With this radio I found it's easier to hit the repeater full quieting on these walks if I use the 440 link instead of the 2M one.

However, oddly enough, when I go to the Saturday Morning "Coffee With The Hams" in the Merced Mall food court, I can' hit the repeater from indoors at all on 440, and only with a lot of noise on 2M, while if I use it while I'm mobile in the truck, it hits the same repeater fine on 440, WITH the rubber ducky, (again about 25 air miles or so)!

So yes, the radio does work well with the rubber dummy load (or at least mine does) and at least I haven't had to buy the ~19" Diamond flexible duck (costs a good part of what I paid for the radio).

Phil,

The reason why your radio works so well into the repeater is NOT because the standard short rubber duck antenna works so well, it's because the antenna on top of the talk mountain looks down at you when you're only 25 miles away (and probably far less than that in air miles).

As you have noticed, as soon as you get between metal (that blocks the signal) or inside a building (that again blocks the signal) you're suddenly either unable to bring up the repeater or you're very noisy into it. The fastest way to see the difference in antenna performance is to use your radio on simplex, swapping out various antennas while you try to work a friend on simplex 4 to 5 miles away. Believe me, your friend will notice a difference, although since the UV-5R doesn't really have a signal strength meter (it always shows 5 bars or nothing at all), you may not see any difference. In fact, if your friend has a UV-5R as well, he may not see any difference either, although he should certainly hear the difference.

Hi Craig,
Appreciate the answer. Guess I missed making my point.

First, the BXN repeater is ~25 AIR miles from me, give or take. More like 50 driving miles. That's a guest-a-ment, I haven't driven it, though I have driven to Mariposa, closest town to it. Being on "Little Bullion" it does of course have height in it's favor.

BXN DOES have remote receivers in both Merced and Atwater (7 miles away on a water tower), but both of those remote sites have been down awhile

When I ordered the radio, after reading the review mentioning the deaf antenna, I wondered if I was going to need a a longer (19" or so) one to even hit the repeater and meet my desired needs.

Now, I have had a number of high dollar HT's, a couple Yaesu FT-60s and a Yaesu VX8D, it seems when I have a really good HT I always swap it for something HF/LF. The point I failed to make is that, while they have MUCH better receivers, so could hear a bit better, they did no better at hitting BXN on their stock ducks than my UV5R does. With that in mind my (personal) conclusion is that the stock UV5R duck isn't any/much worse than the Yaesu Stock ducks.

<< conclusion is that the stock UV5R duck isn't any/much worse than the Yaesu Stock ducks.>>
Good point. It's rather commonly accepted among hams and commercial operators that the stock rubber duck gives about a minus 3bd "gain". In other words approx one half the signal capabilities as a full 1/4 wave "unity gain" antenna. Whether made by yaesu, ICOM, diamond, or anyone else. Dave J AF0DJ

I too have found this resource valuable.

I live in a smallish town in rural South Australia, so the lack of selectivity of the UV5R that others complain of is actually un-noticeable here.

There are 2 VOX repeaters and one APRS (145.175Mhz in Australia if you happen to come here visiting and wonder why your APRS isn't getting through).

One repeater is 2m Ham on 146.700 and it's roughly 20km from here. Into that with full quieting on the UV5R. I can also hear the APRS digi just fine in and around town, with what sounds like full quieting. I'm having trouble getting audio from the UV5R into my laptop, I wind up with an 'echo' effect for some odd reason. Still investigating, but it seems to be that somehow a feedback loop is being created within the computer. I have a Win 10 desktop that doesn't have this problem, but laptops always seem to have 'issues'. The other repeater is the UHFCB repeater on Ch4/34 (476.500/477.250) and it can hit that with full quieting as well. I've not seen any selectivity related issues with the radio and the sensitivity seems ok as well, I could still hear VK5RMN on 2m almost to Kadina, the best part of 100km from the repeater. Didn't try getting into it from there as I was driving, but it was certainly hearing the ID.

This is a 'low traffic' area as far as radio is concerned. The Repeaters are silent about 90% of the time unless someone is using the IRLP link to hookup to an overseas repeater.

Again, unlike the US, most hams source their BaoFengs from China or Hongkong direct, not via Amazon or any local online sellers simply because Amazon is a PITA to deal with from here and there aren't many online ones locally.

Geoff in Oz

Yes Phil, that is correct. We make fun of the stock Baofeng antenna but having recently purchased a FT60R I found exactly the same issue. The stock duck was WAY worse then an after market quality antenna. Manufacturers would make their customers a lot happier if they equipped their HTs with quality antennas out of the box, but cost would go up a few dollars which I guess is the issue for them. Keeping cost competitive.

That said, it doesn't mean that a factory antenna won't be good enough to do the job for someone who lives in range (with the stock antenna) of their favorite repeaters. However as a lot we all seem to try out best to get more range out of our rigs than we will ever really need anyway.

Yaesu VX8D(R) - my dream HT. But that is another gorup...

Do you have antenna in mind? Please post a URL if you wish,
I'd like to see what would work better. Presently, I do have
the stock rubber dummy antenna. I also have one or two longer
antennas from Ebay, but you've probably got one online which
will really work better.

I think the “free shipping” costs are simply built into the price of the product, which itself may be priced at the factory at such a low level, that when the shipping costs are added to the item’s price, the price is still very low, or at least attractive.

A lot of things shipped from China vendors are sent via international mail, and the customs declaration shows the contents are a “gift”. The authorities there look the other way, so this becomes a government subsidy for small and medium business in China. The mail delivery may take some time, because the items are often literally on a slow boat from China. So, if you are not in a hurry, you can score a bargain.

Whether the bargain is truly worth it, or fair market trading, are other questions.

52992. BF-888S voice scrambler

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-23 16:22:07 UTC
From: Ray Sills
Topic: 52992 Message: 52992

I have a pair of 888s' that I have been able to program via CHIRP, at least for frequency and PL. But, I have discovered that these units have the frequency-inversion/ "scrambler" function enabled. That's not good for my ham radio intended use.

In looking at the pages on the Miklor site regarding the 888, it appears that the scrambler function can be "set"…. which implies that it can be "un-set". But, there is no particular indication as to how you do that.

Is this something that can be dealt with via CHIRP and one of the "spreadsheet" data items?

I have a few of these gems. It took great discipline not to enable the feature and play around on "other freqs". this is a great radio for the local repeater. I found the stock antenna worked better than some of the other antennae I experimented with.

CHIRP doesn't support a setting for the "voice scrambler." To modify that you require the Baofeng software, At lease I haven't found another way to do it myself.

OK Jim you made me look using a fresh download from a BF888 which is confirmed to have the scrambler. I am using Chirp 20150616 and there is no column even with hide disabled which seems to be the voice scrambler nor do I see any settings in the radio download which I don't recognize as something other than the scrambler setting. What is the column name?

HI Jim:

FB! I was hoping that CHIRP would do the job. The OEM software is PC only, IIRC, so I'll try CHIRP on my Mac. I just don't recall seeing a column in the spreadsheet that says "scramble".. or words to that effect. I'll need to look more closely.

Thanks!

According to this you can do it:
Rob, You can already edit this with CHIRP. The "extra features" of the BF-888s are available from the right-click -> edit menu. Click on a memory to highlight it, or control-click and/or shift-click to highlight a group of memories. Then right-click any highlighted memory and select "Edit" from the pop-up menu. The "Beat Shift(scramble)" setting that you want to edit is at the very bottom. Jim KC9HI

II use the Pofung T88 version which is a better export 888 but I think the same software is used.

Click on the memory channel desired

in the drop menu select > properties

in that form select OTHERS tab

scrambler option is the last check box

And, I just looked at the 888 with the 20150814 daily of CHIRP, and did not see anything related to the scrambler.

Maybe the enable/disable is only on a PC version. I don’t know where my copy of the OEM software is at the moment.
And, I’m not sure it would run under emulation.

Also, -for sure- the scrambler is “on”… easy to tell when monitoring a busy channel. :)

Close, but I found it. Those instructions are probably for a much older version of Chirp. It is right click on a row (channel) >Properties>Other>Best Shift (scramble) enabled (check box). So it is well hidden, but it is there in Chirp.

Thanks Mike, I never would have found that.

HI Jim:

FB! I was hoping that CHIRP would do the job. The OEM software is PC only, IIRC, so I'll try CHIRP on my Mac. I just don't recall seeing a column in the spreadsheet that says "scramble".. or words to that effect. I'll need to look more closely.

Thanks!

CHIRP does support this setting. This is a per channel setting and since it is outside the scope of the "spreadsheet style memory editor", it is considered an "extra" setting. The Memory Properties menu is used to edit "extra" settings. Here is how it is done...

Click on a channel row to highlight it.
Click the [Properties] button
Click the "Other" tab in the "Memory Properties" menu that appears
Enable/disable the "Beat Shift(scramble):" setting
Click the [OK] button

I am using a 5RV2+ with the extended battery. There is a connector hole on the upper, side of the battery which should be a charger hole but when I received amobile charger the connector is the wrong size. Do they actually expect us to carry the drop-in charger and use this charger unit?

Tom

Actually the socket on the side of the extended battery is NOT for charging the battery -- unless you build a properly regulated charger yourself. The socket is simply connected to the battery terminals (just like two of the contacts on the back of the battery). Connecting most "chargers" to that jack will simply blow up the battery.

Hi Jim:

That was it! Thanks, Jim!

Too bad the setting is not in the spreadsheet, but, c’est la vie. I made the changes, and ran a test with my local repeater, K3DN, and everything is just fine now.

Now, I’ll be all set for when my grandson decides he wants to get his Tech license. :)

HI Jardy:

Heavens to Betsy, NO! Aside from the legal issue, I want to be able to use it with my local repeater, K3DN. Turned out, although I was able to use CHIRP to upload new frequencies to replace the factory settings, a good number of the 16 channels had the scramble feature turned on. The scramble mode made listening to the local machines impossible.

Anyway, thanks to Jim, I have it squared away, and all is fine.

Tom,

To use the side port for charging, you have to actually buy a charger. Something that has the charging smarts to shut off when the battery is fully charged. Not just something that provides DC to the socket.

TYT sells a TH-UVF9 that has the charging accessories that will work with the side charging port. Unfortunately is isn't easy to see them sold separately. I recently found them on Amazon and bought the one for the car, but it is currently unavailable.

House: http://www.amazon.com/TYT-TH-UVF9-CDQ-Generic-Charger/dp/B00DOR7B1M
Car: http://www.amazon.com/Generic-Original-2-Way-Radio-TH-UVF8D-TH-UVF9D/dp/B010CMAJRO

409shop also sells a fast charger for use on commercial mains. It is also available included with an extended battery.
http://www.409shop.com/409shop_product.php?id=109135

Without these charging devices, you can only use the side port to provide power to an external device that runs off of 7.4 volts.

Which “side Port” are we refering to? The only side port that I see is for the programming cable and the speaker mike.

Ray,

Say you never discovered how to access the setting in CHIRP to disable the scrambler, all you would have to do is save the current channels as a standard CHIRP Radio Image (*.img) file. Then "import" that image file to the current tab. During the import process you can unselect the channels that you don't want to import (the scrambled ones) and then remap the channels that you do want to import (the unscrambled ones) to overwrite the channels that you don't want (the scrambled ones). The scrambler would then be disabled on all 16 channels. Once that is done, you can edit the channels as you wish.

This is why I usually recommend importing an IMG files over any other method of transferring channels between radios. Importing CSV files or using copy and paste will not transfer the "extra" settings.

The side port on the extended battery. It can be used for powering external devices or, with the correct charger, be used to charge the battery (without the charging cradle).

Don't put much faith in "the mobile charger that was supposed to be for [the] radio" either. Most of the so-called mobile charger cables sold for these radios are simply a cigarette lighter plug on one end and an coaxial plug at the other -- with nothing in between but two copper wires. They pass the car's full voltage through to the charger with no regulation -- which is OK with the TYT charger but pretty much guarantees failure of the BaoFeng charger.

No. The mobile charger you are talking about is not a charger. It is just an adapter cable that plugs into the car's electrical system and the charging cradle. The charging cradle still does the "work".

And most of these get that wrong and should not be used. The reason is because they output 12 volts instead of the correct 10 volts that the charging cradle requires. The extra 2 volts is on the high end of the range that the IC in the charging cradle can use. Since the IC does not have a heat sink, it will get too hot.

If you don't get any of the devices that I posted links to, then what you have is probably not correct for charging the extended battery.

Even easier here. There is presently no tax on goods under $1000 value bought from overseas. This will change next year when the 10% GST will be imposed on such purchases, there’s no Customs Duty on low value items either and that will not change. I’m wondering how the govt will get Hoo Flung Dung in his back alley shop in Hong Kong to sign up to pay Australian GST – I suspect a lot of small sellers will try and work around it or just ignore it – uncertain how that will effect goods on arrival – the govt seems to forget that a lot of the trade is not from large Chinese firms that will probably sign on to it, but from thousands of small traders. But at present, you pay the $2 for whatever it is and it’s shipped from China – no fuss and no need to mark it as anything except what it is. That said, I’m wondering about the batteries – LiPo and Lion batts theoretically are not permitted to be air freighted – yet it appears quite a few are. One of the theories behind the loss of Malaysian Three Seven Zero is that a shipment of Lion batteries in the hold may have self combusted. Delivery is usually 3 weeks or so to Australia from China or Hong Kong.

I think the “free shipping” costs are simply built into the price of the product, which itself may be priced at the factory at such a low level, that when the shipping costs are added to the item’s price, the price is still very low, or at least attractive.

A lot of things shipped from China vendors are sent via international mail, and the customs declaration shows the contents are a “gift”. The authorities there look the other way, so this becomes a government subsidy for small and medium business in China. The mail delivery may take some time, because the items are often literally on a slow boat from China. So, if you are not in a hurry, you can score a bargain.

Whether the bargain is truly worth it, or fair market trading, are other questions.

Geoff, check that the microphone is disabled on the laptop. Chips and gravy! You bet! sometimes even chili and cheese! I prefer no bean chili.

That could be the issue – so far I can’t seem to do that without killing the external mic input as well. I’ll keep at it. I fed it to a Win 10 desktop box but yet to get AGWPE to decode packets – seems to be some echo in there as well, not sure why, there’s no inbuilt mic, APRSICE is talking to AGWPE ok, but no joy on signals from the digi – only via the internet connection so far. Next to no traffic on the APRS digi here, so long waits for a databurst.

It’s also a tight fit for the 2.5mm plug into the speaker output socket on the BF, might have to file one side of the plug down a little so it clears the case easily.

Never tried chilli and cheese on chips – different. Do you mean chilli sauce (like Thai Sweet Chilli Sauce?) Chilli has beans in it?

The one or two events I was on, a day of radio reports, and the HT still shows 3 of 3 bars of power. Makes me wonder how much TX is needed, before you need a mobile charger. At least, when the operator can come home to a charger at home. I do carry a spare battery on radio events, but not yet needed it.

On "events" most operators (other than the Net Control) should have VERY LITTLE to say.

Some other users are in completely different situations -- there are plenty of BaoFeng users who are "ratchet jaw" types - mostly former CBers who have moved to illegally using these radios on GMRS or simply randomly chosen frequencies.

And, of course, we have lots of new hams where the BaoFeng is their first rig, and they have no knowledge about things like operating duty cycles or battery capacity. Most of the mobile chargers and Battery Eliminators are aimed at these users who simply cannot believe that in the real world you will be transmitting less than 10% of the time and that one of these little radios (even with the standard battery) will easily last a full day of typical use.

Also remember that many new hams (with various model radios) also don't understand how repeaters actually work, or how to program their radios, or that simplex even exists.

That does make perfect sense. An extended mobile operation might also need 12 volt charge. Both good reasons to have a charge base. Also buddy aid, where the next man over forgot his charger.

Hmm, wondering if you’ve had any success with a BaoFeng UV5R and a laptop for APRS over there? Or is yours just for voice? Mine is still, um, resisting, thinking about an external USB sound card as a last resort, since the internal stuff seems to have a mind of its own. I’m going to try uninstalling and reinstalling the drivers first though.

I ordered a pack of eight BF88 batteries last month (only AU$32 for 8, needed as I run 4 radios regularly) and they only took 3 weeks to get here to Sydney. Oddly enough the pack was labelled (in the standard tiny print) as being li-ion battery x8, and then had the NOT-dangerous/prohibited goods declaration signed as well.
Maybe they arrived by sea, but in "only" 3 weeks I assume it was by slow-air.
Ian in Oz

---In baofeng_uv5r@yahoogroups.com, <spqrantiquities@...> wrote :

Even easier here. There is presently no tax on goods under $1000 value bought from overseas. This will change next year when the 10% GST will be imposed on such purchases, there’s no Customs Duty on low value items either and that will not change. I’m wondering how the govt will get Hoo Flung Dung in his back alley shop in Hong Kong to sign up to pay Australian GST – I suspect a lot of small sellers will try and work around it or just ignore it – uncertain how that will effect goods on arrival – the govt seems to forget that a lot of the trade is not from large Chinese firms that will probably sign on to it, but from thousands of small traders. But at present, you pay the $2 for whatever it is and it’s shipped from China – no fuss and no need to mark it as anything except what it is. That said, I’m wondering about the batteries – LiPo and Lion batts theoretically are not permitted to be air freighted – yet it appears quite a few are. One of the theories behind the loss of Malaysian Three Seven Zero is that a shipment of Lion batteries in the hold may have self combusted. Delivery is usually 3 weeks or so to Australia from China or Hong Kong.

If you really want a good antenna, invest in one of the roll-up j-poles or slim jims made by N9TAX or Ed Fong. They cost $20-30, but believe me, you won't be sorry.

So long as you are in a stationary position (and not in a RF hot zone), I would agree, but remember (for those of you that live in major metro areas), the UV-5R front end is wide-open, so the more gain the antenna provides, the more likely you are to hear additional interference.

53055. Trouble with mic/earpiece plugin.

Yahoo group: baofeng_uv5r (2015)

Attachments: 1 described; binary payloads are missing from this source WARC

I just got my new UV5r and had a problem when plugging in the earpiece/mic. When I plugged it in, it went into transmit mode immediately. I think that the unit I got was a third party knock off. Since I love to tinker to figure things out, I took the unit with the push button apart. It just unsnaps. When I did, I discovered that the ground braid was shorting out on one of the connectors of the switch. I had to unsolder a couple of the wires to move them into position to where they did not short out. It now works the way that it is suppose to. Also added a couple of drops of hot glue on the wires to make sure that they would not move and short out again. The attached picture is the earpiece that I am talking about. I hope this helps anyone who has the same problem.

As do I. I use his DBJ2 as my base antenna connected to a BFF8+ via RG8 with RG58A leader in the house and do surprisingly well. Most people who know my location cannot believe that I am using just an HT as my TX source. Of course I have trouble with the notoriously poor selectivity of the Baofengs and have to put receive PLs on some channels.

Since no one seems to publish true gain specs (I know that is a whole discussion in itself) on their j-pole antennas (fixed or roll-up) I am wondering if anyone has ever compared the roll-ups like Ed's or N9TAX window line j-poles with fixed types like the Arrow or any of the DIY types like the copper pipe. Do the fixed types have any TX/RX advantage over the roll-ups? Obviously they are going to be more rugged if left up for long periods, but is there a notable performance difference?

And I am referring to using them with Baofengs as that is my base installation as well as travel kit along with some nylon line and a fishing weight.

I had used slimjim antenna just using pvc water pipe and a measured length of electrical wire with RG58A as feeding cable. I pump 1watt power keeping in LOW mode.

Slim Jim / J Pole Antenna Calculator
http://www.m0ukd.com/calculators/slim-jim-and-j-pole-calculator/ Calculate the dimensions for a Slim Jim or J Pole antenna for HF, VHF or UHF - Including velocity factor!

View on www.m0ukd.com http://www.m0ukd.com/calculators/slim-jim-and-j-pole-calculator/
Preview by Yahoo

the calculations for 145.000 are done using above link and the performance to reach my repeater that is 10Km away is fine
people also receive me directly at 15KM away.

53060. Programming Cable for MAC

I have one of the "questionable" USB programming cables that I can use with out a problem on my windows computer, but if I use it on my Macbook, when I attempt to download the data from the radio using CHIRP, the radio will TX briefly, then I get the error that the radio did not respond. I shorted the TX and RX on the interface plug and ran a terminal program it (loopback test) and it works fine. Any thoughts?

Also is there a known source for a FTDI chipset cable that will work with both my UV-5R and my UV-3R? All the ones I see with multiple adapters seem to have the prolific chipset.

I found an FTDI programming cable on Amazon. It cost $20, IIRC. Like many people, I had originally opted for a cheaper cable that was less than $10. It was a Prolific cable, and even had the Baofeng name (including their font style) on the cable. But, it was no go on my macbook, or iMac.

The FTDI works just fine on both machines. The MB has OS 10.10.5, and the iMac has OS 10.5.8. One thing I did discover is that sometimes you have to hold the rig end of the cable firmly into the rig. Sometimes the connection can be “iffy”.

I use my FTDI cable with a BF-888S and a UV-5R. And my program used is CHIRP, which has a multitude of rigs that it supports. Don’t forget to select the FTDI USB port while in CHIRP.

Bottom line: you have to spring for the FTDI cable. One option might be for people who have an Elecraft USB cable, is to fabricate an adapter that will permit you to connect to the Baofeng rigs at one end, and the “stereo” 3.5mm plug at the other.
Elecraft adapters use genuine FTDI chips. I don’t know what the pinout is for the rig plug, but obviously it’s a 3-wire circuit.
TXD, RXD, and ground.

I purchased the 3rd part driver from mac-usb-serial. I know the USB-Serial is working because the loopback test works, and I even tried it with an arduino putting out serial data to a pin. This is not a driver issue, or least it does not

Thanks John,

That tells me some of what I was wondering. The VHF test seems valid and interesting. I would have guessed by my experiences that the DBJ1 would have had a bit more gain than the others. Unfortunately the UHF test used VHF antennas compared to the dual band DBJ1 which doesn't seem like an apples and apples comparison. Not sure why the UHF test wouldn't have compared the DBJ1 to other dual banders or UHF references as in the VHF test did. I would have expected it to have more gain at UHF than a 1/4 wave VHF only mobile too as occurred in the VHF test.

Also the UV5R cable is not compatible with the UV3R. It is compatible with the UV3R+ and two pin Kenwood radios. This seller is one of the few FTDI sources I have found (actually the only) for UV3R (single pin) cables. Also note that just because a cable looks identical (like a UV3R and Yaesu) they are not wired the same inside and do not interchange.

53067. boat racing event

Yahoo group: baofeng_uv5r (2015)
Date: 2015-09-27 23:58:08 UTC
From: Christopher Young
Topic: 53067 Message: 53067

Had a pleasant time at a volunteer event, as an amateur radio operator.

The net control guy thanked me for attending, and treated me with great kindness.

The non radio guy where I was assigned counter-mandeed my orders, telling me NOT to keep track of boats leaving and return, that I should ask his clerk secretary wehn I needed information. My radio boss stopped by, I explained the clash of orders. He said to go with the boat guy's directions.

Sadly, there was pretty much no where in the shade. I borrowed a folding chair from the boat house, and the chair feet kept settling into the soil. Not allowed to be on the asphalt walkway, that was used by boaters launching and returning boats.

Net control was working out of a trailer with a mobile set. At about 100 yards away, that mobile wiped out the Baofeng receive. He did work off his five watt HT, which only wiped out my receive when he was about 60 yards or closer. Some day when I have more money, I'd love a better quality HT.

My HT did reach the repeater okay. No one complained about under modulation.

A couple of the fellows took it to simplex. I went to follow them, but took a while to change in freq mode. Thinking back, I could have beeped in the freq, instead of scrolling with arrow up. And I could have put the simplex in my freq mode well before needing it. Some thing to do next time.

I had marine channels in one of my HT, and managed to bring the OTHER one. No big loss, I did have the repeater we were using that day.

Items used out of my radio bag: Sunscreen. Hat. Bottle of water. Food was provided at the event. The ID badge with my name and call sign on it helped many times as people figured I was someone official. Even if I was totally clueless, I still

looked good.

Needed but didn't have: big bottle of aches and pains pills.

Had but didn't use: Binoculars, my own clip board. I did bring a long sleeve jacket, which was OK in the morning, but not used as the day grew warmer.

I left "my" chair at one point, and left my jacket on the back. Return to find some one sitting in it. I didn't want to be a total hypocrite, and ask him to get out of the chair I had just lifted from some one else. He moved after a while.

Overall, had a lot of fun. Got to be part of the action, and use my handi talkie. I am quite impressed with groups of teen agers (either 4 or 8 on a craft, with a captain) working together and taking directions from a crew captain. Really swells my heart with pride, and I'm not even related to any of these fine young people.

There was endless prep which went into the event. Scheduling, food, parking, and on and on. The endless list of preparations.

As a radio guy, I heard early when other crafts passed the start or finish. I knew when there was a passing tour boat, for example.

To my knowledge, no injuries. And no boats were capsized or sunk.

And a good time was had by all. Even the people walking dogs on leash were having fun. I did get to scratch a couple dogs. Which I enjoyed.

When all boats had been launched, I was released from my position at the launch dock. And given another position. This time, I was able to spend more time in the shade. On release from that, I put the chair back in the boat house where I'd found it. Be a good idea to bring my own chair to events.

Net control released me "secured" and thanked me again. I hobbled my sore bones to the truck, took some pills, and headed to lunch with Mom.

Hi Christopher

So you were Radio Active, that is always fun. Where was the event held?

<<< Sadly, there was pretty much no where in the shade. >>>

I would like to show you my chair which has a canopy. Check it out http://www.amazon.com/Quik-Shade-MAX-Chair-Navy/dp/B00SKZYHEC/ref=sr_1_1?s=outdoor-recreation&ie=UTF8&qid=1443449367&sr=1-1&keywords=camping+chair+with+canopy and I got mine for $25.00 or something around that price. I don't know how it will perform in soil, I guess this is one of these problems to avoid if you can.

Also invest in one of these hi-tech cooling towels. http://www.amazon.com/gp/product/B00ISL6PSY?psc=1&redirect=true&ref_=oh_aui_detailpage_o05_s01

You dip it in some water, snap it and it will cool you down considerably. I love this item, big enough to drape it on your head but not too heavy, plus mine is orange so it can be used to spot people. Oh and as you are looking on the site they also make hats and baseball caps from the same material. It is a good idea to be prepared for multiple weather conditions.

I also would carry a tablet, I have an iPad Mini with some neat radio apps, and some games. When it's down time I can take photos, play chess, or even check email.

<<< A couple of the fellows took it to simplex. I went to follow them, but took a while to change >>>

My radio is set up in this way:
Repeater frequencies
Simplex frequency
Repeater Input frequency for checking and testing. For all frequencies that I might need.

Water is very important. I have a bottle that can keep ice for > 12 hours. It is made by Thermos and I got it from Target for about $20.00

<<< Food was provided at the event >>>

Don't count on it. I have been "forgotten" so many times that now I have a pocket full of granola bars and things like that.

Carry extra batteries and different antennas. Make pig tales too.

Do you have a safety vest? One can come in handy and you will certainly look official wearing one.

<<< The non radio guy where I was assigned counter-mandeed my orders, telling me NOT to keep track>>>

In my book, if instructions did not come from Net Control, they mean nothing to me. Now I can always inform NC of what someone asked me to do, and clear it through NC, so we are all on the same page.

<<< And a good time was had by all>>>

And that is the most important part. We do this to help out and have fun doing it. Great job Christopher, I wish you the best.

CY: I have a couple, actually. One is small enough I can cram it into my radio bag. Rides in the truck with me in case I need to get out and change a tire. I should have one in my radio bag. Yesterday, there were probably 100 people with safety vests, so it would not have made much difference.

Sorry, missed a question. Western NY, along the
barge canal. The racers were really a sight. It
is nice to see a team of teen agers or college age
people working together as a team.

Since the race was only a mile or two, we might
well have done the whole race simplex with handi
talkies. I'm not sure what is the range from HT to
HT.

I could set up one of my HT next to tape recorder.
Drive away, and TX each time my odometer ticks
off 0.1 miles. Go back and play the tape, see when
I lose signal.

From: Sean Cooke
Topic: 53072 Message: 53072

Good morning, afternoon or evening!

I have two UV5REs which I bought at the same time and from the same place... Up until very recently, they both worked a treat on chirp and I'd happily program away with no worries. Now, one of them fails to respond to chirp. It just won't....the other is fine and no hassle. This other radio won't have it at all. Can anybody please tell me what could be the matter with it and if there's some type of fix for this issue? Oh, by the way, I take my licence test on Sunday!

One other possibility - if they are different firmware versions (very possible), it may be going to the very latest daily build of Chirp might help. Hard to say, but worth trying.

To add to what others have already stated, just because you purchased them at the same time does not mean the two radios have the same firmware releases (as internet dealers rarely - if ever - keep track of the firmware releases in their inventory), so one of the radios may have caused Chirp to hick-up, which is what has suddenly caused your issue.

While it would be possible that the two radios bought at the same time from the same dealer might have different firmware versions, that does not seem to account for the facts as reported by the original poster: 1) Both radios have been successfully programmed with Chirp previously; and 2) One radio now suddenly does not communicate with Chirp

A firmware mismatch should have produced a warning in Chirp right from the start -- unless he was using a very old copy of Chirp and has just updated his copy of Chirp without mentioning it.

And a firmware mismatch would not prevent the radio from communicating with Chirp - it would generate the error message on attempting to upload the mismatched image file.

For mismatched firmware to be the problem, just about everything the original poster said would have to be incorrect.

I avoid the mismatched radio firmware issue completely (so far at least) by simply using RT Systems in place of Chirp.

As to Chirp not being the issue, that "may" be true, but as you stated - only if the user is currently using a newer version of Chirp and has not recently upgraded it from an older version that "was" working previously.

I've seen dozens of users have issues with Chirp for a wide variety of reasons, including the fact that many (most?) of them get so frustrated getting their fake Chinese cloned cables to work that once they do they NEVER want to change anything (for fear of having programming issues again).

Sometimes they feel "forced" to upgrade to a newer version of Chirp (so it will support a newer version or model of a radio) and at that point their "fun" can start all over again. As Rich, Jim (and others) have stated many times, making a copy of the original settings of your radio with Chirp "should" be step # 1, but many users completely skip that step, and as we have seen many times in the past, skipping steps with these radios and their software is almost guaranteed to cause an issue eventually.

If the original poster gives us more data, we'll all have a better idea of what's going wrong, but unless he plugged one radio into 220v or dumped it in a water bucket (or something similar), my initial bet would be a programming issue caused by a cable driver or new version of Chirp, as electronic hardware "generally" doesn't just go bad sitting on a shelf. Typically (from a MTBF rate) it's either bad to start with or works a very long time.

I have never used RT systems due to the fact that one package costs more than the radio and I have never had any issue with Chirp other than it's complicated documentation. However with any "universal" thing there are compromises. I know those who use RT always love it, but I wonder if that comes with some sacrifices. Does it allow one to set squelch thresholds, display light timeout longer than with keypad set length and so forth? I suspect that these things which make Chirp more complicated also make it more flexible. Not saying it is, just wondering if it is.

Christopher,

Thank you for giving us a hand at the regatta. I found out that the mobile radio in the ARES trailer was putting out 75 watts - no wonder it wiped out every HT nearby. (It didn't have an instruction manual, and I did not see a way to lower the output power.) Once you made me aware of the problem, I continued by using the HT I brought (Kenwood TH-F6), sending at 5w, or less in some instances. To reach you more effectively, I usually just sent on the frequency the repeater was using as an output (pushed the Reverse button on my HT). I don't know if the Baofeng UV-5R has that reverse feature to easily switch to transmitting on the repeater's output frequency -- I'll have to check mine (I brought it as a back up, but didn't end up using it this year).

I think your UV-5R worked very well and you got into the repeater clearly. Next year, if I can get a better antenna installed at the start line, 2.4 miles away, I'd like to run the regatta on simplex instead of using a repeater. The HAM there could hear me with 5w on my HT, but I could not copy him at all. That location has two huge steel guard gates and the steel framing to hold them up above the canal, and I suspect some of his RF was being blocked by them.

You weren't the only one with a Baofeng UV-5R -- others had them as well, and were monitoring the FRS channels the non-HAM volunteers were using. I don't think, though, that the UV-5R can monitor two incoming frequencies at the same time (another feature I'll have to check for). If that is possible with the UV-5R, I could then run everything on simplex, and let the HAM at the far end of the course call in on the repeater, which we could all be monitoring to catch his transmissions (or, I could just end up relaying his transmissions on the simplex frequency).

CY: Well, 75 watts, we could have cooked hotdogs on the antenna....

> To reach you more effectively, I usually just sent on the frequency
> the repeater was using as an output (pushed the Reverse button on my HT).

CY: That works. The BF can be run in simplex mode, either programmed or using frequency mode.

CY: One of the buttons on front throws it into frequency mode, you can type in or scroll to the freq you want. Might not have PL, probably not.

>
> I think your UV-5R worked very well and you got into the repeater
> clearly.

CY: Nice to know the equipment worked. That was the one Bill Kasper sold me through my radio course, and came with the perinton repeater program in already.

> Next year, if I can get a better antenna installed at the start line,
> 2.4 miles away, I'd like to run the regatta on simplex instead of

Might be able to wire a handi talkie to a magnet mount antenna, and magnet to the metal of the bridge? Or use a longer antenna on the HT?

> The HAM there could hear me with 5w on my HT, but I could not copy him
> at all. That location has two huge steel guard gates and the steel
> framing to hold them up above the canal, and I suspect some of his RF
> was being blocked by them.

CY: Some times, move the radio operator a couple feet does wonders. Have the HT operator sit on a step ladder? Life guard chair with a big megaphone?

>
> You weren't the only one with a Baofeng UV-5R -- others had them as
> well, and were monitoring the FRS channels the non-HAM volunteers were
> using.

CY: I do remember seeing a LOT of FRS talkies around. I do have several that I bought over the years. The Baofengs are physically capable of doing FRS freq. On carrier squelch, might need CHIRP to put in tone squelch, if that was needed. I find FRS has about half mile range. Some of my FRS sets have the tone squelch codes also.

> I don't think, though, that the UV-5R can monitor two incoming
> frequencies at the same time (another feature I'll have to check for).

CY: With the Baofeng, the channel mode shows two channels on the face. I suspect the radio will listen two channels at the same time. I'd planned to listen to marine 16, but that was on the blue Baofeng which I left home. Sigh.

> If that is possible with the UV-5R, I could then run everything on
> simplex, and let the HAM at the far end of the course call in on the
> repeater, which we could all be monitoring to catch his transmissions
> (or, I could just end up relaying his transmissions on the simplex
> frequency).

CY: As the issue seems to be keeping in contact with the far ham, a couple ideas. Might set up the far ham with a mobile, mag mount, and a car battery. Give him (her) the 75 watt mobile. Or a borrowed mobile. Your HT had a longer antenna than my stubby, maybe the far guy needs a longer antenna. Maybe the far guy needs his whole body, self, HT, antenna up on a life guard station chair?

CY: I live not all that far away from the race. If you like, I can meet you some day after the rain clears. We can try radios and antennas, use cell phone as fall back. See if my Baofeng on 5 watt with magnet antenna on the bridge metal will reach your HT. I enjoy playing with situations like this. Might also move the radio guy, so he's got the bridge behind him. In any case, I'll do what I can to help out.

Concur. Counterintuitive to pay more for programming software than the radio.
Aside from some very minor issues first time around, I've had no difficulties with my $7 from Hong Kong programming cable (which I think is Prolific not FTDI) and Chirp under Windows 7 either. Not sure about Win 10 yet, that machine has yet to be updated.
Only place I've even heard of RT Systems is in this list actually, don't even know of any Aussie hams using it, but another local ham clued me about Chirp vs the BaoFeng software before I even bought the radio. Both actually work ok, but Chirp is somewhat easier for doing major operations. That said, I've used it to do something exactly twice – when I programmed my radios when I first got them. Never needed to change anything since, which is another reason to avoid expensive commercial 'solutions' like RT. I have exactly two radios that use Chirp/BaoFeng, the rest are surplus commercial /\/\ rigs that have their own specialist software. (And need real DOS or at most Win98SE in MSDOS mode to run them – not to mention using a Pentium 1-166mhz machine as most things faster than that won't run them (not to mention the lack of genuine 16450 or 16550 UART based serial ports to work with).

I know of a couple of locals using RT Systems here in VK7, Geoff.
Certainly works and is very simple but at a cost and is also applicable
to just the radio brand you bought it for, unlike CHIRP.

I use all three, the VIP version, Chirp and RTS. I do radio programming for at least a few dozen uv5R + clones and others (Uv82) at least once a week if not more.

When you have multiple radios that you must program for various routes and models not yet supported by Chirp, RTS is a good solution.

Yes Chirp could respond faster to more model support and upgrades but we have to be honest here.. “Does the average Baofeng buyer send any donations to the Chirp development group to help them in their model development?”

Experience dealing with the Baofeng buyers here at my end, they expect a free battery or some other accessory along with the radio for under $30. I will not even bother selling anything that is not a HP (8W version) which we do not sell at under $30 no matter how much begging there is.

This is where RTS fails, it is NOT free. Those with computer issues would rather come here and ask the same questions that are answered already on Miklor than to spend $ for the software. That fact is never going to change either.

Endless phone calls and complaints that Chirp is a virus and I am at fault for sending them to download it for free, I now suggest RTS software with a working cable. If they have issues the RTS tech support group can answer the questions too. This saves me a headache from all hour calls about Windows updates installing wrong drivers and other issues.
Those that can understand radios and computer issues I give them a choice and even include a disk with drivers and both Chirp and VIP in each radio box. Those that fit the profile of inept programming or following instructions I suggest RTS.

So RTS DOES have a good purpose in the Baofeng market- even if it does cost something. It is the better choice for some people.

Never needed to change anything since, which is another reason to avoid expensive commercial 'solutions' like RT. I have exactly two radios that use Chirp/BaoFeng, the rest are surplus commercial /\/\ rigs that have their own specialist software. (And need real DOS or at most Win98SE in MSDOS mode to run them – not to mention using a Pentium 1-166mhz machine as most things faster than that won't run them (not to mention the lack of genuine 16450 or 16550 UART based serial ports to work with).

I agree Rich. Those that value their time tend to prefer RT Systems. Those that don't tend to prefer freeware (and there are other choices besides just Chirp).

If you are programming just one or two radios, or have learned how to correctly change software drivers (or can get others to support you for free), Chirp or VIP do work. Of course if you run Linux or Mac O/S, you are probably going to run Chirp, but if you want to program any of the newer radios that Chirp either doesn't support at all, or only supports in a limited role, you are going to use RT Systems.

Try copying your existing UV-5R template and then programming a Wouxun KG-UV9D or TYT TH-8000D (both have been out for months), and neither are supported by Chirp, so you either use the god-awful Chinese manufacturer's software, do it by hand, wait months for Chirp support, or use RT Systems and get it done today. I, like you, have used many different software programs (including Chirp) to program various amateur and Icom/Kenwood/Motorola/Relm/Vertex commercial radios, so I'm familiar with their quirks as well.

Freeware appeals to folks that believe it's really free (they never consider the time it takes them to learn it and then support it when Baofeng makes another firmware change), but aside from the upfront cost difference, I've yet to meet anyone (new to programming radios) that has seen Chirp, RTS, and VIP side by side that doesn't prefer RTS. Of course many folks will blast RT for daring to charge "real money" and think that $30 radios are the standard for hams worldwide. Icom, Kenwood, and Yaesu continue to sell radios at 10 times (or more) the Baofeng price point because many hams see the value in their additional features, performance, options, etc., I think the same is true for RTS. I get that some see the value and others don't.

RTS really shines with the Travel Plus interface and like you mentioned taking a Wouxun uv8D and making the Wouxun 750P match up exactly in channels. Many want their radios to follow the same order which RTS shines to mix models with the same program scheme.

BTW the MD 380 TYT DMR is pretty awesome, doing the programming on this now. I have a code plug example so now up on the regional and world gateways. Just adding a few extra local wide area coverage analog channels.

If you need to demo this at your table let me know I will give you my radio ID and you can add it to your contacts and send text messages or calls for demo’s.

Really awesome running on the Papa system here.

When you have multiple radios that you must program for various routes and models not yet supported by Chirp, RTS is a good solution.

Yes Chirp could respond faster to more model support and upgrades but we have to be honest here.. “Does the average Baofeng buyer send any donations to the Chirp development group to help them in their model development?”

Experience dealing with the Baofeng buyers here at my end, they expect a free battery or some other accessory along with the radio for under $30. I will not even bother selling anything that is not a HP (8W version) which we do not sell at under $30 no matter how much begging there is.

This is where RTS fails, it is NOT free. Those with computer issues would rather come here and ask the same questions that are answered already on Miklor than to spend $ for the software. That fact is never going to change either.

Endless phone calls and complaints that Chirp is a virus and I am at fault for sending them to download it for free, I now suggest RTS software with a working cable. If they have issues the RTS tech support group can answer the questions too. This saves me a headache from all hour calls about Windows updates installing wrong drivers and other issues.
Those that can understand radios and computer issues I give them a choice and even include a disk with drivers and both Chirp and VIP in each radio box. Those that fit the profile of inept programming or following instructions I suggest RTS.

So RTS DOES have a good purpose in the Baofeng market- even if it does cost something. It is the better choice for some people.

When you work on hundreds of devices, it's not uncommon to have a tool that costs more than the device being worked on.

In closing, I'll simply say that I use the freeware because I don't dare waste what little money I have (mostly unemployed) on radio software. So I use Chirp (or VIP) and like it. My time isn't costing me money, but commercial anything does so I avoid it like plague, and that's also why I'm using obsolete radios like MTX838s and other Moto stuff because it's dirt cheap on the s/h market.

If I had a full time job that payed real money I'd probably say heck with it and buy a better radio in the first place (Yaesu et al) but that's a luxury I don't have.
It's also why I'm slowly restoring a Yaesu FT200 because I can't just lash out a few hundred bucks to buy anything better.

I'm not suggesting RTS isn't good value for money, hell, I've never even seen it. From the description it's quite good and I've no doubt that description is accurate.

The other thing is that 'Baofeng buyers' here buy from China via ebay. Pretty much without exception. There are no gun shows, hamventions or wherever it is that you peddle your radio gear here – or at least not around here in country S.A. Think maybe a club or two somewhere may run a swap meet, but that's probably about it. So everyone uses ebay and deal direct with Chinese suppliers because the few Aussie ones are found only on ebay, charge rather more and the radios are no different.

I like the BaoFengs because for less than my $67 annual Ham License fee (And it's more like $45 for a UV5R here than than $30 let me add) I can get a working, handheld, UHF VHF radio that I can 'set and forget'. Mine's the best part of a year old. Unlike others that are, shall we say, 'well off' if it breaks, I WILL fix it if I can, but then I also fix computer power supplies rather than toss them and buy new ones (depending what broke) and the odd TV set (including the only flat screen in the house - big Pioneer Plasma - which had a dead resistor in the PS so I got it for nothing, cost of repair 30c and an hour of my time, most of it getting the back on and off... screws and screws and screws..).

So far I've rebuilt the antenna twice on each of the UV5R radios. (the coupling cap tends to break off at the point it connects to the centre of the connector due to bending the antenna and stretching the wire. Next time it happens I'll probably pot the whole thing with epoxy so it doesn't flex at all.) Oh, and if anyone knows where I can get (preferably from China) replacement switch membranes for the various side switches and the keypad, that would be great.

I do get where you guys are coming from, I guess the circumstances are simply rather different.

Cheers

Geoff

Not only limited to one radio brand, but one radio model line within that brand making it even more selective and expensive if you have multiple models.

I have exactly two radios that use Chirp/BaoFeng, the rest are surplus commercial /\/\ rigs that have their own specialist software. (And need real DOS or at most Win98SE in MSDOS mode to run them – not to mention using a Pentium 1-166mhz machine as most things faster than that won't run them (not to mention the lack of genuine 16450 or 16550 UART based serial ports to work with).

Subject: Re: [baofeng_uv5r] Re: Chirp difficulties!

I have never used RT systems due to the fact that one package costs more than the radio and I have never had any issue with Chirp other than it's complicated documentation. However with any "universal" thing there are compromises. I know those who use RT always love it, but I wonder if that comes with some sacrifices. Does it allow one to set squelch thresholds, display light timeout longer than with keypad set length and so forth? I suspect that these things which make Chirp more complicated also make it more flexible. Not saying it is, just wondering if it is.

How does RT Systems handle the Baofeng firmware incompatibility issues? Or dies it simply not manage the settings whihc are firmware dependent...

---In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote :

I use all three, the VIP version, Chirp and RTS. I do radio programming for at least a few dozen uv5R + clones and others (Uv82) at least once a week if not more.

When you have multiple radios that you must program for various routes and models not yet supported by Chirp, RTS is a good solution.

Yes Chirp could respond faster to more model support and upgrades but we have to be honest here.. “Does the average Baofeng buyer send any donations to the Chirp development group to help them in their model development?”

Experience dealing with the Baofeng buyers here at my end, they expect a free battery or some other accessory along with the radio for under $30. I will not even bother selling anything that is not a HP (8W version) which we do not sell at under $30 no matter how much begging there is.

This is where RTS fails, it is NOT free. Those with computer issues would rather come here and ask the same questions that are answered already on Miklor than to spend $ for the software. That fact is never going to change either.

Endless phone calls and complaints that Chirp is a virus and I am at fault for sending them to download it for free, I now suggest RTS software with a working cable. If they have issues the RTS tech support group can answer the questions too. This saves me a headache from all hour calls about Windows updates installing wrong drivers and other issues.
Those that can understand radios and computer issues I give them a choice and even include a disk with drivers and both Chirp and VIP in each radio box. Those that fit the profile of inept programming or following instructions I suggest RTS.

So RTS DOES have a good purpose in the Baofeng market- even if it does cost something. It is the better choice for some people.

Well one thing with the cheaper Chinese radios , thousands have got into Ham radio that might have otherwise never thought about it- for various reasons.

The Baofengs are great starter radios, this is why I will always carry them even though the profit is often less than $10 per radio on my end- and that is with a programming setup for the end user.

Some of the new digitals have some solid promise as this system is really starting to take off, however there will be also a place for the Baofeng's.

Subject: RE: [baofeng_uv5r] Re: Chirp difficulties!

In closing, I'll simply say that I use the freeware because I don't dare waste what little money I have (mostly unemployed) on radio software. So I use Chirp (or VIP) and like it. My time isn't costing me money, but commercial anything does so I avoid it like plague, and that's also why I'm using obsolete radios like MTX838s and other Moto stuff because it's dirt cheap on the s/h market.

If I had a full time job that payed real money I'd probably say heck with it and buy a better radio in the first place (Yaesu et al) but that's a luxury I don't have.

It's also why I'm slowly restoring a Yaesu FT200 because I can't just lash out a few hundred bucks to buy anything better.

I'm not suggesting RTS isn't good value for money, hell, I've never even seen it. From the description it's quite good and I've no doubt that description is accurate.

The other thing is that 'Baofeng buyers' here buy from China via ebay. Pretty much without exception. There are no gun shows, hamventions or wherever it is that you peddle your radio gear here – or at least not around here in country S.A. Think maybe a club or two somewhere may run a swap meet, but that's probably about it. So everyone uses ebay and deal direct with Chinese suppliers because the few Aussie ones are found only on ebay, charge rather more and the radios are no different.

I like the BaoFengs because for less than my $67 annual Ham License fee (And it's more like $45 for a UV5R here than than $30 let me add) I can get a working, handheld, UHF VHF radio that I can 'set and forget'. Mine's the best part of a year old. Unlike others that are, shall we say, 'well off' if it breaks, I WILL fix it if I can, but then I also fix computer power supplies rather than toss them and buy new ones (depending what broke) and the odd TV set (including the only flat screen in the house - big Pioneer Plasma - which had a dead resistor in the PS so I got it for nothing, cost of repair 30c and an hour of my time, most of it getting the back on and off... screws and screws and screws..).

So far I've rebuilt the antenna twice on each of the UV5R radios. (the coupling cap tends to break off at the point it connects to the centre of the connector due to bending the antenna and stretching the wire. Next time it happens I'll probably pot the whole thing with epoxy so it doesn't flex at all.) Oh, and if anyone knows where I can get (preferably from China) replacement switch membranes for the various side switches and the keypad, that would be great.

I do get where you guys are coming from, I guess the circumstances are simply rather different.

Cheers

Geoff

RTS has given the same error with a download from radio info box, but that has happened only for the latest batch that just arrived from China. Within a few days an update corrects this. Chirp corrects this in daily builds too.

RTS has advantages and Chirp does too, I can see an user not wanting to pay $50 for it for 1 $30 radio. For those of us with various radios to program RTS becomes another tool.

The biggest reason for a single use radio owner to get RTS is:

1. They live in an area with hundreds of repeaters and travel

2. They cannot get past the driver issues.

3. They have mobiles that they want to match with HT channel line ups.

4. They have various HT’s that they want to match between cross models.

RTS has given the same error with a download from radio info box, but that has happened only for the latest batch that just arrived from China. Within a few days an update corrects this.

I haven't seen this (at least not yet). When RTS detects a different firmware that it expects, all I've had to do is do a read from the "suspect" radio (which so far at least, it's always done correctly), switch back to the first screen (with the template I want to upload into the radio), and send the new info to the radio. So far, that's worked every single time with no extra issues.

I'm not saying that it won't happen, I'm just saying that Baofeng firmware changes haven't stopped me yet. That "might" have something to do with the frequent updates that RTS does every week, so "if" somebody else gets hung up and sends the file to RTS they may have already fixed the issue before I know it existed.

I also like how easy it is to have the RTS software check to see if you have the latest file (which I do weekly at least) and then update the software you have, plus not having to fix a cable driver if somehow MS managed to sneak in another Prolific driver update, or having to trim poorly made cables to get them to fit, or not having to wait months to get a new radio supported, etc., etc. Having them handle the noob tech support calls with an 800 number is "priceless" (sorry MasterCard). I guess it's true - you normally get what you pay for.

BTW, I dropped a hint with RTS about the MD380. It would be their first MotoTrbo radio project, but can you imagine how much additional MotoTrbo interest there would be if it had RTS support?

Subject: Re: [baofeng_uv5r] Re: Chirp difficulties!

RTS has given the same error with a download from radio info box, but that has happened only for the latest batch that just arrived from China. Within a few days an update corrects this.

I haven't seen this (at least not yet). When RTS detects a different firmware that it expects, all I've had to do is do a read from the "suspect" radio (which so far at least, it's always done correctly), switch back to the first screen (with the template I want to upload into the radio), and send the new info to the radio. So far, that's worked every single time with no extra issues.

YES IT HAPPENED once then RTS the next day had an update the rest of the radios programmed without the error message, most likely it was corrected very quickly on that release.

I'm not saying that it won't happen, I'm just saying that Baofeng firmware changes haven't stopped me yet. That "might" have something to do with the frequent updates that RTS does every week, so "if" somebody else gets hung up and sends the file to RTS they may have already fixed the issue before I know it existed.

I also like how easy it is to have the RTS software check to see if you have the latest file (which I do weekly at least) and then update the software you have, plus not having to fix a cable driver if somehow MS managed to sneak in another Prolific driver update, or having to trim poorly made cables to get them to fit, or not having to wait months to get a new radio supported, etc., etc. Having them handle the noob tech support calls with an 800 number is "priceless" (sorry MasterCard). I guess it's true - you normally get what you pay for. yes I got sick of helping people fix their computer issues, most of the people I was helping had no business trying to program the radio anyway as it was fully setup- for some reason they “wanted to change something” one guy told me he saw on YouTube someone could put 27mhz CB radio channels in the radio.. these people I tell them to get RTS so I am off the hook for constant support or I just refuse to sell them a radio, I tell them to go to Baofeng tech instead. You know how bad they must be to send to someone else to buy it, those people are the ones that constantly want to be able to transmit to the Police dispatch or something stupid like that. I am getting better dealing with this, I can quickly tell whom I am dealing with and if they are going to call a few times a day, or do something disruptive/illegal with the radio. I tell them to go online to Baofeng tech and make it clear we will not program their radio for them. This is more polite than telling them to beat it.

BTW, I dropped a hint with RTS about the MD380. It would be their first MotoTrbo radio project, but can you imagine how much additional MotoTrbo interest there would be if it had RTS support?

That would be awesome, luckily someone had all the code plugs to do an initial setup then to tweak it in a few areas. The data getting all the digital parameters and gateway talkgroup ID’s was difficult guesswork. Now that I found them it makes it a really good radio. I will not sell these radios fully op unless the buyer has a valid call sign though, or I will sell as is without the programming part. I do not want to be responsible for misuse of the linked systems here. So will set this as a policy due to the capabilities of this radio. Better yet, a valid call sign and registration on Marc for a digital radio ID, as I need this ID to program them.

Or I sell as is to licensed Hams that can do the programming ok by themselves as DMR is tricky for a new DMR user.

Here is my radio ID 3106976 if you can enter the linked system for Kalifornia and send a text

Chirp works for me. I have no doubt that RT Systems software is good, but I have no need for it. I run Linux, and Chirp with my cable was basically plug-and-play. I had no driver issues.

I guess I've been very lucky with my Baofengs, Chirp and my cable because I've had no major problems.

I do agree with R. Pryor that the Baofengs have been very good for ham radio by reeling in thousands to ham radio who wouldn't otherwise be hams.

53099. Programming Problen

Recently received a UV-5R and manually programmed it using KD2DHI's guide. Everything was fine, saved it to memory. When I went to channel mode however I lost all my settings - offset, CTSS, etc.

What am I doing wrong?

Thanks,

Mike

Topic: 53102 Message: 53102

I have a UV-5r and a boat load of UV-5RE+ HT's.

I loaded up channels to monitor, and disable transmit by setting DUPLEX to OFF. When I completed the download to the radio using chirp (WIN 10), I attempted to transmit on one of the disabled channels. Not only did it transmit, it "stuck" in transmit and the only way I got the radio to exit transmit (swiftly anyways) was to turn the radio off.

This only occurred on the UV-5R, not the UV-5RE's, they all disabled transmit.

Any ideas on that one radio ?

thanks.

Linux users (in general) tend to have a higher degree of computer savvy than most Windows users, so it wouldn't surprise me a bit that Prolific software driver issues aren't an issue in the Linux world.

I do agree that the onslaught of cheap Chinese radios has brought more folks into ham radio, but I don't think the majority of Chinese radios sold end up on the amateur bands (although I agree that many do). Most Baofeng users seem to start on FRS, GMRS, or MURS, so lets hope that they eventually end up on ham frequencies.

As some on this forum have discovered, the cheap price of Baofeng radios means that their front ends are easily overloaded with strong nearby signals, but "most" of the time that isn't too big an issue.

I'm not going to guess without more information.

Which version of CHIRP were you using?

Did you upload the same "CHIRP Radio Image" file to all of the radios?

What is the "real" firmware version of each of the radios (Settings ->
Other Settings -> Firmware message 1:)?

chirp version is daily 20150814

Real firmware is N5R2401

downloaded file from radio, open 2nd data file, copied some cells, pasted
cells into file that was downloaded from the radio, then uploaded the file
to the radio.

Did this multiple times with same experience

Marc,

There is nothing wrong with your process. Does the radio still do
this? If it does, download from it and save it to a file. Then email
the file to me: uv5r [at] kc9hi [dot] net

I'll take a look at it to see if there is anything unusual.

No, before I started I reset the unit via MENU 40, then went to
frequency mode to program.

>Offsets only work in VFO mode, not memory.

Then memory mode is useless for repeater use?

Radios don't need offsets to work repeaters. Offset were something hams dreamed up back in the 70s to save on thumb wheel switches for the newly introduced frequency synthesized radios. They could do this because ham repeaters used a standardized "offset" between the RX and TX frequency. You dialed in the RX frequency and then flipped a switch to + or -. Before that, crystals were used, .1 for the RX frequency and 1 for the TX frequency. There had never been a requirement to have an offset.

These radios are programmed with the RX frequency and the TX frequency for repeater, odd-split and cross-band operation. No "offset" is necessary.

Even when you use CHIRP, you program the RX frequency and the Offset (because for some reason many hams think you have to have them), then CHIRP calculated the TX frequency and sends the RX and TX frequencies to the radio because that is what it uses.

Subject: Re: [baofeng_uv5r] Re: Chirp difficulties!

Well one thing with the cheaper Chinese radios , thousands have got into Ham radio that might have otherwise never thought about it- for various reasons.

That seems to be the case. We have several new Foundation Class hams (the most basic level there is) as a direct consequence of them being available.

The Baofengs are great starter radios, this is why I will always carry them even though the profit is often less than $10 per radio on my end- and that is with a programming setup for the end user.

Since the radios invariably are bought over ebay from China the programming is either done by the buyer or if they aren't up to it, one of the more computer savvy Advanced Class guys does it for them.

Some of the new digitals have some solid promise as this system is really starting to take off, however there will be also a place for the Baofeng's.

Wondering how long it will be before the Chinese start producing something similar.

Subject: RE: [baofeng_uv5r] Re: Chirp difficulties!

In closing, I'll simply say that I use the freeware because I don't dare waste what little money I have (mostly unemployed) on radio software. So I use Chirp (or VIP) and like it. My time isn't costing me money, but commercial anything does so I avoid it like plague, and that's also why I'm using obsolete radios like MTX838s and other Moto stuff because it's dirt cheap on the s/h market.

If I had a full time job that payed real money I'd probably say heck with it and buy a better radio in the first place (Yaesu et al) but that's a luxury I don't have.

It's also why I'm slowly restoring a Yaesu FT200 because I can't just lash out a few hundred bucks to buy anything better.

I’m not suggesting RTS isn’t good value for money, hell, I’ve never even seen it. From the description it’s quite good and I’ve no doubt that description is accurate.

The other thing is that ‘Baofeng buyers’ here buy from China via ebay. Pretty much without exception. There are no gun shows, hamventions or wherever it is that you peddle your radio gear here – or at least not around here in country S.A. Think maybe a club or two somewhere may run a swap meet, but that’s probably about it. So everyone uses ebay and deal direct with Chinese suppliers because the few Aussie ones are found only on ebay, charge rather more and the radios are no different.

I like the BaoFengs because for less than my $67 annual Ham License fee (And it’s more like $45 for a UV5R here than than $30 let me add) I can get a working, handheld, UHF VHF radio that I can ‘set and forget’. Mine’s the best part of a year old. Unlike others that are, shall we say, ‘well off’ if it breaks, I WILL fix it if I can, but then I also fix computer power supplies rather than toss them and buy new ones (depending what broke) and the odd TV set (including the only flat screen in the house - big Pioneer Plasma - which had a dead resistor in the PS so I got it for nothing, cost of repair 30c and an hour of my time, most of it getting the back on and off... screws and screws and screws..).

So far I’ve rebuilt the antenna twice on each of the UV5R radios. (the coupling cap tends to break off at the point it connects to the centre of the connector due to bending the antenna and stretching the wire. Next time it happens I’ll probably pot the whole thing with epoxy so it doesn’t flex at all.) Oh, and if anyone knows where I can get (preferably from China) replacement switch membranes for the various side switches and the keypad, that would be great.

I do get where you guys are coming from, I guess the circumstances are simply rather different.

Cheers

Geoff

I think Icom would take them to court if they copied D star to capture that market. However, a really good DMR radio is the TYT MD 380 utilizing TDMA and MotoTurbo,

This is the one I got two samples to play with and have been programing them all day. Ask Craig about as he is a TYT authorized dealer.

Good radio though for the price.

I'm not going to guess without more information.

Which version of CHIRP were you using?

Did you upload the same "CHIRP Radio Image" file to all of the radios?

What is the "real" firmware version of each of the radios (Settings -> Other Settings -> Firmware message 1:)?

Ok, thanks mate, haven’t seen that one yet. Will have to take a look. Agree about DStar, possibly FreeDV might go at some point.

They are already producing digital radios, Geoff. Anytone is one that comes readily to mind. I doubt though they will pick up the digital protocols now being used in amateur digital radios, such as D Star.

Well one thing with the cheaper Chinese radios , thousands have got into Ham radio that might have otherwise never thought about it- for various reasons.

That seems to be the case. We have several new Foundation Class hams (the most basic level there is) as a direct consequence of them being available.

The Baofengs are great starter radios, this is why I will always carry them even though the profit is often less than $10 per radio on my end- and that is with a programming setup for the end user.

Since the radios invariably are bought over ebay from China the programming is either done by the buyer or if they aren’t up to it, one of the more computer savvy Advanced Class guys does it for them.

Some of the new digitals have some solid promise as this system is really starting to take off, however there will be also a place for the Baofeng’s.

Wondering how long it will be before the Chinese start producing something similar.

Subject: RE: [baofeng_uv5r] Re: Chirp difficulties!

In closing, I'll simply say that I use the freeware because I don't dare waste what little money I have (mostly unemployed) on radio software. So I use Chirp (or VIP) and like it. My time isn't costing me money, but commercial anything does so I avoid it like plague, and that's also why I'm using obsolete radios like MTX838s and other Moto stuff because it's dirt cheap on the s/h market.

If I had a full time job that payed real money I'd probably say heck with it and buy a better radio in the first place (Yaesu et al) but that's a luxury I don't have.

It's also why I'm slowly restoring a Yaesu FT200 because I can't just lash out a few hundred bucks to buy anything better.

I'm not suggesting RTS isn't good value for money, hell, I've never even seen it. From the description it's quite good and I've no doubt that description is accurate.

The other thing is that 'Baofeng buyers' here buy from China via ebay. Pretty much without exception. There are no gun shows, hamventions or wherever it is that you peddle your radio gear here – or at least not around here in country S.A. Think maybe a club or two somewhere may run a swap meet, but that's probably about it. So everyone uses ebay and deal direct with Chinese suppliers because the few Aussie ones are found only on ebay, charge rather more and the radios are no different.

I like the BaoFengs because for less than my $67 annual Ham License fee (And it's more like $45 for a UV5R here than than $30 let me add) I can get a working, handheld, UHF VHF radio that I can 'set and forget'. Mine's the best part of a year old. Unlike others that are, shall we say, 'well off' if it breaks, I WILL fix it if I can, but then I also fix computer power supplies rather than toss them and buy new ones (depending what broke) and the odd TV set (including the only flat screen in the house - big Pioneer Plasma - which had a dead resistor in the PS so I got it for nothing, cost of repair 30c and an hour of my time, most of it getting the back on and off... screws and screws and screws..).

So far I've rebuilt the antenna twice on each of the UV5R radios. (the coupling cap tends to break off at the point it connects to the centre of the connector due to bending the antenna and stretching the wire. Next time it happens I'll probably pot the whole thing with epoxy so it doesn't flex at all.) Oh, and if anyone knows where I can get (preferably from China) replacement switch membranes for the various side switches and the keypad, that would be great.

I do get where you guys are coming from, I guess the circumstances are simply rather different.

Cheers

Geoff

Most repeaters use/used crystal controlled analog radios and a duplexer, one radio for receive and one for transmit. Its hard to receive and transmit on one frequency with one or two analog radios.. normally takes two frequencies, ie: offset freq to keep the transmit signal out of the receiver.

Different thing with digital signals.. multiplexing is easy..

Since the Chinese don't seem to care at all about copying other vendor's products, I don't think they would be bothered by any legal threat from Icom. I think the only reason some digital products are appearing now is that they believe it will help them move into the commercial market (like MotoTrbo), whereas Icom's D-Star is strictly an amateur radio level product (today at least). Now "if" Icom started producing commercial rigs with D-Star, then all bets are off.....

I don't think Icom could, as they don't own the CODEC, as I understand things. They licence it from the IP owner. No doubt the actual owner would sue though. The fact that it is a proprietry CODEC is sufficient to persuade me never to use it or buy a product that incorporates it. I favour the open source FreeDV. Hopefully FreeDV will soon appear in VHF/UHF radios and give D Star a run for its money. Meanwhile, it is used on HF.

D-Star is supposed to be open to anyone that wants to use it.. Icom is the only company to use it so far. The WIRES and WIRES-x are Yaesu, and they would probably fight anyone else using it.

Jardy Dawson
WA7JRD Ham Radio

Message relayed through SETI (Search for Extra-Terrestrial Intelligence, although no terrestrial intelligence has been found yet, either)

On Sep 30, 2015, at 20:58, 'R Pryor MAEd CETsr' doopsnoop@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

It is actually Codec2. FreeDV is a program that incorporates Codec2. If you buy a SmartMic, you can connect it to a UHF/VHF radio and then use Codec2 in that capacity.

I don't think Icom could, as they don't own the CODEC, as I understand things. They licence it from the IP owner. No doubt the actual owner would sue though. The fact that it is a proprietry CODEC is sufficient to persuade me never to use it or buy a product that incorporates it. I favour the open source FreeDV. Hopefully FreeDV will soon appear in VHF/UHF radios and give D Star a run for its money. Meanwhile, it is used on HF.

TOTAL NONSENSE.

Digital or Analog, the only way to transmit and receive on the same frequency simultaneously is to NOT do it simultaneously. You have to resort to TDMA (Time Division Multiple Access) which is to say that you receive first, then stop listening and start retransmitting. With digital systems it is possible to shorten the length of the listen phase and transmit phase more than is practical with analog, but no matter how short the intervals and now quickly you interleave them, the time to retransmit on the same frequency is still double the duration of the original signal.

You can make the encoding "digital" all you like, but the radio waves still follow the laws of physics.

Subject: Re: [baofeng_uv5r] Programming Problem

Most repeaters use/used crystal controlled analog radios and a duplexer, one radio for receive and one for transmit. Its hard to receive and transmit on one frequency with one or two analog radios.. normally takes two frequencies, ie: offset freq to keep the transmit signal out of the receiver.

Different thing with digital signals.. multiplexing is easy..

There is a lot of tap-dancing about D-Star being an "open" codec. The codec itself is supposedly open, but the only practical way to implement it in something like an HT is still a proprietary chip. Icom does not have an exclusive license, but the licensing fees are enough to keep others from being interested. You can work around the problem by implementing the codec in software but that isn't practical for an HT, especially not a cheap HT.

Yes, the Chinese could illegally clone the chip and probably wouldn't worry too much about the resulting copyright infringement lawsuit, but they would worry about US Customs seizing every infringing radio found entering the US (likewise Canada, Australia, and the UK each of which do a better job of inspecting incoming articles).

You're not likely to see fake clone D-Star radios flooding the US any time soon.

Subject: Re: [baofeng_uv5r] Re: Chirp difficulties!

D-Star is supposed to be open to anyone that wants to use it.. Icom is the only company to use it so far. The WIRES and WIRES-x are Yaesu, and they would probably fight anyone else using it.

My Baofeng UV-5R Repeater Programming:

ON
A/B = A
BAND = VHF
VFO/MEM = Frequency Mode
146.865 <--enter frequency
MENU - 26 - MENU - 000600 - MENU - EXIT
MENU - 25 - MENU - + - MENU - EXIT
MENU - 11 - MENU - 88.5 - MENU - EXIT
MENU - 27 - MENU - 004 - MENU (Receiving Memory) - EXIT
*SCAN <-- should see an R by the +/- and CT
MENU - 27 - MENU - 004 - MENU (Transmitting Memory) - EXIT

where 146.865 is the repeater frequency, and
+ is the offset direction, and
88.5 is the CTCSS tone, and
004 is the memory channel

This has worked for me, so far.
I am a brand-new Ham, so the usual warnings apply:
Use the information at your own risk.

That is insane.

You cannot transmit and receive at the same time on a single freq with analog equipment using voice communications even with a duplexer. You have two signals on the same freq that cannot be separated.

With digital modes, the audio is sliced, decimated, packeted with headers that keep the packets in the right order and going to the correct receiver, and transmitted very quickly. Receivr copies the other station's digital signal and decodes into voice (no need for freq offset). On UHF and above, several digital audio/speech conversations can be made at the same time on a single freq... examine your cell phone, and you will see how it works.

> communications even with a duplexer.

OK, ignoring for the moment the fact that you don't seem to even comprehend what a "duplexer" is (Hint: it has nothing to do with a single frequency), the rest of what you said about not being able to transmit and receive at the same time on a single frequency is true -- what you seem unable to understand is that it is equally true of "digital" equipment (Here's another hint: Radio waves are analog regardless of how you modulate them)

Old story
Running W7 32 bit machine. Old driver for prolific rs232>usb had been working but somewhere along the line W7 did an auto update and it no longer works.

When I go and remove the new driver and reinstall old driver on next boot it appears that W7 automagically installs new driver and I'm back where I started? Any suggestions?

53133. Re: cannot maintain old prolfic driver on W7

First thing to do is to remove the old driver in device manager and then install the older working driver. Turn off automatic updates and then when you manually check for updates, hide the updated driver from Windows update. You can then turn automatic updates back on.

The EASIEST way is to read the information from the table in Chirp

If you insist on doing it the hard way, just bring up the channel on the 1st radio and open the menu for the characteristic you want to see. This works for everything EXCEPT offset and direction because these radios DO NOT USE offset or direction in memory channels.

As Xaun stated, since the radio doesn't use offset or direction for repeater, odd-split or cross band channels, you have to find the TX frequency that was programmed into those types of memory channels.

To do this, select the memory channel in a display that has its Memory Display Format set to FREQ (menu 21 [MDF-A] or menu 22 [MDF-B]). Then tap the [*] key to toggle the radio into "reverse mode" (the letter "R" will be indicated in the upper status display). The TX frequency is now displayed for the selected memory channel. Tap the [*] key again to exit reverse mode.

Well, you CAN run a repeater on a single channel with ‘digital’ equipment. Think AX25 Digipeater, it’s simplex by design.

It’s also possible to run a voice (simplex) repeater on a single channel – using a store and forward method – in principle that’s how a digipeater works. It’s cumbersome, somewhat slow and inefficient, but yes, it does work and can be done with nothing more complex than a loop of tape on a recorder, or digital recording of some kind if you want ‘high tech’.

However, two stations SIMULTANEOUSLY transmitting on one frequency unless there is some suppressed carrier different single sideband trickery going on (technically possible I think, but I’ve never tried it or seen it done) would clearly not result in anything but loss of the intelligence sent by both signals or the stronger wiping out the weaker.

Thanks guys. The other thing I notice is that the "Memory Channel" menu option is the last channel I had programmed no matter what channel I am trying to see. I did program some simplex channels on the first radio. This is why I was asking the question because I got confused as to exactly what I was looking at.

Thanks again.

Thank you, Geoff, that is exactly what I said. The only way that "digital" works as a repeater on a single channel is by first receiving THEN repeating back what it received (which, oddly enough, is contrary to the FCC definition of a "repeater")

Subject: RE: [baofeng_uv5r] Re: Digital NONSENSE

Well, you CAN run a repeater on a single channel with ‘digital’ equipment. Think AX25 Digipeater, it’s simplex by design.

It’s also possible to run a voice (simplex) repeater on a single channel – using a store and forward method – in principle that’s how a digipeater works. It’s cumbersome, somewhat slow and inefficient, but yes, it does work and can be done with nothing more complex than a loop of tape on a recorder, or digital recording of some kind if you want ‘high tech’.

However, two stations SIMULTANEOUSLY transmitting on one frequency unless there is some suppressed carrier different single sideband trickery going on (technically possible I think, but I’ve never tried it or seen it done) would clearly not result in anything but loss of the intelligence sent by both signals or the stronger wiping out the weaker.

> That is insane.

Yes, your original post claiming "digital" systems could operate a repeater on a single channel WAS insane.

> You cannot transmit and receive at the same time
> on a single freq with analog equipment using voice
> communications even with a duplexer.

OK, ignoring for the moment the fact that you don't seem to even comprehend what a "duplexer" is (Hint: it has nothing to do with a single frequency), the rest of what you said about not being able to transmit and receive at the same time on a single frequency is true -- what you seem unable to understand is that it is equally true of "digital" equipment (Here's another hint: Radio waves are analog regardless of how you modulate them)

I use a local DMR 'repeater' that uses clock signals via a gps signal.It is my understanding that this allows a second repeater to be synced with the first.The repeaters have a data connection via a dish - don't know what freq the data link uses.

When TDMA came out in the military in the late 70’s (I went to school on the system in 1981) we would use both analog and digital feeds into a multiplexor. The multiplexors used strapping and a channel calculation requiring data timing and fill bits. You calculated out the max data rates, strapped the cards for each input channel. When the multiplexors fed into the QPSK modems, the clock signals (timed by Cesium Beam frequency standards) would clock the data slots at higher sampling rates for the high BW emissions. Example a satellite image spy satellite or space shuttle link would be given a higher data frame usage compared to a ground analog voice channel. This allowed T3 data streams to be fed into the modems to modulate to a 70 mhz IF. TDMA allowed this to be easily accomplished compared to the older FDMA stuff.

That data also could be bulk encrypted which generally it was. So you’re correct in the clock portion, a clock had to be used referenced to a time base to insure TDMA signals had the right timing. We just used Atomic Clocks while Ham radio would use an accurate reference timing source from something different.

We also had the first internet operational for DOD in 1983 and used Fiber optic networks for speed and security emissions in the late 1970’s.

Interesting to see all of this integrated into the WWW, Ham radio or FIOS many years later.

Are you saying that you have a Baofeng radio where the s-meter moves to different bars depending on the RX signal strength? If so, you may have a miracle baby.

Some UV-5R models (and its many variants) have had this ability for
some time. I don't own any, but I was loaned one back in March that
had this ability. It had N5R-219 firmware (141006N so it was
manufactured 1 year ago). It also had the ability to manually program
a repeater channel in a single write (the TX frequency is
automatically computed from the SFT-D and OFFSET values and stored
along with the RX frequency when it is written to and empty memory).

The UV-B5 and UV-B6 models have always been able to do this.

I'm curious just what advantage a "working S meter" offers while hunting (or anywhere else for that matter). Do you use the UV-3 to listen to the animals talking to each other and use the S-meter readings to let you know when you are getting closer to one of them?

I have 2 USB ports on the front of my computer.

I download and installed the v3.2.0.0 USB driver. Then I plugged the programming cable into the left USB port. I then selected the v3.2.0.0 driver per step 11 of the miklor.com guide. I took note of the COM port assigned to the programming cable.

Then I unplugged the programming cable from the left USB port and plugged it into the right USB port. Once again I selected the v3.2.0.0 driver per step 11 of the miklor.com guide. Then I went into the advanced settings and changed the assigned COM port to be the same as the COM port assigned to the left USB port.

With it configured this way, I can plug the programming able into either USB port and they will both use the v3.2.0.0, driver, they will both use the same COM port and the software will use the same settings no matter which USB port I plug the programming cable into.

Hi,
"Fox Hunting" is a popular Amateur Radio "Sport". Some clubs have them frequently, others seldom or not at all. But the real enthusiasts get deeply involved, often connecting handheld directional beams to their HT's, others even rig up directional beams on their cars so they can triangulate and find the distant fox more quickly.

The individual who 'hides' the fox sometimes get VERY creative in how they hide it. I've seen them in garbage cans, a hollow tree, anywhere a Xmitter may be hidden out of site and still radiate. The Xmitter usually transmits an ID, sometimes with breaks in between.

The Transmitter locating skills that are learned are often used by Hams to trace Bootleggers and/or jammers etc using repeaters/frequencies they aren't licensed for.

My "fox hunting" is going after aircraft ELTs (emergency locating transmitter), EPIRBS (water), and MLB (mountain locating beacons), which all transmit at least a low power 121.5 signal. Yes, the new units use 406, most with GPS info, but they still have low power 121.5 to help on the homing in. Unfortunately, the FAA and FCC quit using satellites to monitor this frequency, but it is still in use. One of our local repeaters is set up to monitor the frequency and to tagteam it onto the normal squelch tail. We have to find it in case it is a real emergency, or stop it if accidental, as it might cover up a "real" signal. It is to find these as long as it does not involve a real emergency. Lots of things can set them off.

There is some pretty specialized equipment for chasing EPIRBS and ELTs, such as the Lil Lper, which allows you to dial in attenuation to the point you have to be right on top of the device to hear the signal. Combined with a highly directional antenna, it is actually pretty easy to track an alerting device.

Using an amateur handheld, much less so. But still can be done, and is fun and informative exercise. Using body shielding for direction finding really teaches newer hams how much your body can attenuate a signal.

Our team, Silver Star Search and Rescue, of Washougal, WA, is responsible for covering SW WA. We have found somewhere around 50 of these, mostly using mobile fan radios that can cover 121.5 to pick up the initial signal, then hts to body shield with. We do have lpers and a Doppler unit, but find a lot can be done with very little. No big Yagis.

Yaesus (VX-7, FT-60, FT-8800) work very well for this. To attenuate the signal, put 121.5 in VFO, as you get closer, tune away from 121.5 until your guess-o-meter shows somewhere in mid range. To really get close, take off the antenna so you are using just the center pin of the SMA mount. Fancy equipment is nice, but not needed. Of course, your radios do need to be able to listen on the airband. A handheld scanner can also work.

This should read "mobile ham radios", not fan radios. Smart phones indeed.

Hi,
"Fox Hunting" is a popular Amateur Radio "Sport". Some clubs have them frequently, others seldom or not at all. But the real enthusiasts get deeply involved, often connecting handheld directional beams to their HT's, others even rig up directional beams on their cars so they can triangulate and find the distant fox more quickly.

The individual who 'hides' the fox sometimes get VERY cr eative in how they hide it. I've seen them in garbage cans, a hollow tree, anywhere a Xmitter may be hidden out of site and still radiate. The Xmitter usually transmits an ID, sometimes with breaks in between.

The Transmitter locating skills that are learned are often used by Hams to trace Bootleggers and/or jammers etc using repeaters/frequencies they aren't licensed for.

Hi Sean

Oh boy what a bummer, now you will have an excuse to spend LOTS of money or radios and antennas batteries and microphones. Your wallet will be empty and you may need to get a 2nd or even a 3rd job just to survive.

Your friends will ask you all about this amateur radio stuff and keep bugging you about it.

Oh but how fun it will be!!!

Congrats and welcome aboard this fun and exiting hobby.

Way to Go!!

Hi Mike

I can see how the size of the UV-3 makes it an ideal radio to use as a fox for fox hunting aka direction finding. I hope my club puts on a hunt some time soon.

Our region is talking about going digital and that means getting a whole new radio system. Right now I have a BF-F8HP analog radio and log using it. I was looking on line and saw that the UV-82C is "Part 90 approved" Does that mean that it will handle the digital encryption? Or should I wait and see if BaoFeng puts out a different radio?

Digital could mean a lot of different things, so don't rush out and buy anything.

First of all, what do you mean by "your region is going digital"? Are you referring to amateur radio, public safety, or something else?

If public safety (police, fire, etc.), then the best thing you can buy is a scanner designed for the type of system your local agencies are getting. No personal radio you buy will be able to work on that system (unauthorized radios on new digital systems will be "stunned" or "killed" by the system the moment they try to log in).

If amateur, it is unlikely your "region" would be going digital, perhaps one or two local repeaters. In that case, if it is important for you to remain active on those repeaters, then you will need to get a radio that is compatible with whatever digital system they are adopting. There are several possibilities, including P25, D-Star, and System Fusion. Digital amateur radios typically cost a lot more than analog, starting out about $500 or so per radio.

<!--/* start of attachment style */ .ygrp-photo-title{ clear: both; font-size: smaller; height: 15px; overflow: hidden; text-align: center; width: 75px; } div.ygrp-photo{ background-position: center; background-repeat: no-repeat; background-color: white; border: 1px solid black; height: 62px; width: 62px; } div.photo-title a, div.photo-title a:active, div.photo-title a:hover, div.photo-title a:visited { text-decoration: none; } div.attach-table div.attach-row { clear: both; } div.attach-table div.attach-row div { float: left; /* margin: 2px;*/ } p { clear: both; padding: 15px 0 3px 0; overflow: hidden; } div.ygrp-file { width: 30px; valign: middle; } div.attach-table div.attach-row div div a { text-decoration: none; } div.attach-table div.attach-row div div span { font-weight: normal; } div.ygrp-file-title { font-weight: bold; } /* end of attachment style */ -->

Part 90 means it is legal for use on part 90 services. It in no way means it is digital compatible.

If Baofeng ever put out a $30 digital I would be really surprised. For a decent Ham radio type digital radio using Mototurbo , look at the TYT MD380. This is a great radio for under $200.

However, registration for the digital radio ID number, you must register on MARC with a valid call sign. The radio will do traditional UHF analog too

Good Morning N7KUW, I was wondering if you could expand on how the system "stuns" or "kills" an unauthorized radio on a system. That makes good sense...I'm not familiar with how such a system (trucked I assume) identifies and isolates such a radio? We had similar systems (Have Quick) when I was in uniform (USAF) but I think it used a freq timing/sequenced method to exclude rather than isolate or "kill" an unauthorized transmitter. Perhaps similar to GPS timing exclusions in the days of SA mode? Not planning anything...just wondering the technology that stuns/kills rather than excludes. Thanks!

The trunked system controller sends data to the radio that inhibits its
use on the system or permanently disables it.
Stun and kill do different things depending on the manufacturer.
Sometimes the radio can be remotely revived.

Tom

There is another reply that answers your question, but I'll chime in also because you asked me specifically.

Large commercial, trunked, digital, public safety systems almost without exception have a master database of every radio that is authorized on that system (in the system controller). As soon as you turn a radio on and select a talk group on the system, the radio transmits to the system saying "I'm here, ready to be used" and the system acknowledges that it is a valid radio and allowed on the system. If the radio is not in the system database, then the system will typically send some type of signal that will disable that radio from being used on that system. Exactly what is done varies by manufacturer, as well as how the system, and radio, are programmed. "Stun" and "Kill" are terms used by different manufacturers to describe how their system can disable an unauthorized radio from being used. I am not an expert in any of those details, or in what differences there may be between the two terms.

When you change "channels" (talk groups), the radio tells the system what talk group you have changed to, and the system acknowledges the radio is now active on that talk group. Again, this is all done in the background, but there is 2-way communication interchange between the system and each radio active on the system. This happens without you pressing the push-to-talk button.

You cannot add a radio to such a system, or even add a talk group to a radio, that isn't part of the specific system design.

It may be possible to program a radio to listen only on such a system, but to do so you may well have to hardware inhibit it's ability to transmit. Much easier just to get a trunking scanner capable of listening to P25 digital (and also much much cheaper). A typical mobile or handheld radio on a Motorola trunked system costs several thousand dollars.

If any of the channels (talk groups) are encrypted, then a scanner won't be able to monitor those channels (talk groups).

And the simple phrase "digital" can mean so many different things. For instance in the US, almost all federally purchased LMR sets are required to be able to operate in the "P-25" digi mode.
There are other digi modes used in ham radio (D-Star being the first one that comes to mind but their are others). Dave J

If Baofeng ever put out a $30 digital I would be really surprised. For a decent Ham radio type digital radio using Mototurbo , look at the TYT MD380. This is a great radio for under $200. However, registration for the digital radio ID number, you must register on MARC with a valid call sign. The radio will do traditional UHF analog too

From: mailto:baofeng_uv5r@yahoogroups.com Sent: Monday, October 05, 2015 7:14 AMTo: baofeng_uv5r@yahoogroups.com Subject: [baofeng_uv5r] Going digital Our region is talking about going digital and that means getting a whole new radio system. Right now I have a BF-F8HP analog radio and log using it. I was looking on line and saw that the UV-82C is "Part 90 approved" Does that mean that it will handle the digital encryption? Or should I wait and see if BaoFeng puts out a different radio?

> radio from being used.

As Carl mentioned, these terms are implemented differently by different manufacturers, and in some cases, they can be somewhat configured by the programmer of individual radios.

Both refer to ways that the net control station can remotely block an individual radio from interfering with or participating in its net.

Generally speaking "Stun" refers to a temporary inhibition which will reset itself after some interval. "Kill" refers to an inhibition which requires specific action to return the radio to usability.

The duration of Stun depends entirely on the radio that has been stunned. It might be as short as 15 minutes, or it might be as long as 24 hours. On some radios, the programmer sets the time of a "stun" within a range established by the manufacturer's firmware. In some manufacturers radios, there is also a REVIVE command that can remotely bring back a radio which has been Stunned, typically in these radios the Stun is permanent until the radio is Revived. Depending on the manufacturer's firmware and the programming settings, "Stun" may actually produce a "Kill"

"Kill" generally means that the radio will not work until it has been reprogrammed, sometimes a simple hard reset will clear a kill, but if the manufacturer has implemented "Kill" correctly it will require at least some action outside the capability of the operator (i.e. it requires connecting the radio to a programmer and/or a "secret" code).

Obviously the manufacturers that are serious about selling to the military or public safety markets implement both Stun and Kill VERY well. Some manufacturers cranking out cheaper radios implement these functions poorly -- but poorly does not necessarily mean easier to work around. Even the cheapest radios I have ever seen with these features require using the manufacturer's programming software to clear a kill.

What Stun and Kill do, also varies with the manufacturer and sometimes with settings that the manufacturer may make available in the firmware. At a minimum, both functions will make a radio unable to transmit on the channel where it was stunned or killed, generally receive is also blocked. In most cases, it will make the radio completely unable to transmit or receive at all on any channel until the stun time has expired or the kill has been cleared.

As has already been mentioned, some trunked systems are programmed to automatically stun any unauthorized radio that attempts to log in to the system. I have not seen any system configured to AUTOMATICALLY issue a kill command, but I wouldn't doubt that there are some systems which do. Usually however the Kill command is meant to be issued manually to remove a radio that has been lost/stolen/captured or cloned to prevent such a radio from being used to interfere with normal operation of the system or to monitor system activity on an encrypted system.

These capabilities originated with military radios for fairly obvious reasons, but quickly became adopted by public safety systems.

Not sure if he’s a Brit or an Aussie.

The Australian Foundation License allows the following privileges:

Radio band

Frequency

Permitted Emission Modes

80 Metres

3.500 MHz - 3.700 MHz

Amplitude Modulation (AM) voice
Single Side Band (SSB) voice
Hand Keyed Morse Code

40 Metres

7.0 00 MHz - 7.300 MHz

15 Metres

21.000 MHz - 21.450 MHz

10 Metres

28.000 MHz - 29.700 MHz

Amplitude Modulation (AM) voice
Single Side Band (SSB) voice
Hand Keyed Morse Code
Frequency Modulation (FM) voice

2 Metres

144 MHz - 148 MHz

70 Centimetres

430 MHz - 450 MHz

Restricted to commercially manufactured equipment (modified if required)

No packet or other digital/data modes.

Power is limited to ten watts maximum regardless of emission mode used.

A BaoFeng would let you work 2 metres and 70cm on FM voice very cheaply and easily – it’s a commercially made radio, 5w FM so it fits the requirements. Many of the local Foundation licensees have these radios for that very reason.

Geoff

I have got to agree with Richard here on this one. The MD-380 is a pretty nice piece of hardware. I've just gotten into DMR, and have found it pretty interesting. It's not like the old digital trunked systems they rammed down our throats at the FD.

But whatever you do, don't try to run your Baofeng programming cable on it. You have to get the TYT cable (it actually uses a USB connection not serial).

BUT ... I will have to point out that the digital is GREAT when everything works. When the repeaters are linked etc etc etc... When there are no repeaters you still have digital point to point, but UHF doesn't seem to carry that far. I still have the trusty Baofeng F8HP handy when I need a little longer range.

I have noticed that living on the island, that the two things that go down even BEFORE an emergency are the mobile phone system and the internent. When the storms or tsunamis were about to hit the mobile phone system got overloaded, and the internet slowed to below old dial-up speeds. The only thing that actually worked reliably was the good old VHF and UHF systems.

But MAN these DMR thingies are FUN!!! Almost as fun as my Allstar/Echolink node!

As Carl mentioned, these terms are implemented differently by different manufacturers, and in some cases, they can be somewhat configured by the programmer of individual radios.

Both refer to ways that the net control station can remotely block an individual radio from interfering with or participating in its net.

Generally speaking "Stun" refers to a temporary inhibition which will reset itself after some interval. "Kill" refers to an inhibition which requires specific action to return the radio to usability.

The duration of Stun depends entirely on the radio that has been stunned. It might be as short as 15 minutes, or it might be as long as 24 hours. On some radios, the programmer sets the time of a "stun" within a range established by the manufacturer's firmware. In some manufacturers radios, there is also a REVIVE command that can remotely bring back a radio which has been Stunned, typically in these radios the Stun is permanent until the radio is Revived. Depending on the manufacturer's firmware and the

programming settings, "Stun" may actually produce a "Kill"

"Kill" generally means that the radio will not work until it has been reprogrammed, sometimes a simple hard reset will clear a kill, but if the manufacturer has implemented "Kill" correctly it will require at least some action outside the capability of the operator (i.e. it requires connecting the radio to a programmer and/or a "secret" code).

Obviously the manufacturers that are serious about selling to the military or public safety markets implement both Stun and Kill VERY well. Some manufacturers cranking out cheaper radios implement these functions poorly -- but poorly does not necessarily mean easier to work around. Even the cheapest radios I have ever seen with these features require using the manufacturer's programming software to clear a kill.

What Stun and Kill do, also varies with the manufacturer and sometimes with settings that the manufacturer may make available in the firmware. At a minimum, both functions will make a radio unable to transmit on the channel where it was stunned or killed, generally receive is also blocked. In most cases, it will make the radio completely unable to transmit or receive at all on any channel until the stun time has expired or the kill has been cleared.

As has already been mentioned, some trunked systems are programmed to automatically stun any unauthorized radio that attempts to log in to the system. I have not seen any system configured to AUTOMATICALLY issue a kill command, but I wouldn't doubt that there are some systems which do. Usually however the Kill command is meant to be issued manually to remove a radio that has been lost/stolen/captured or cloned to prevent such a radio from being used to interfere with normal operation of the system or to monitor system activity on an encrypted system.

These capabilities originated with military radios for fairly obvious reasons, but quickly became adopted by public safety systems.

Baofeng is working on a digital version- I am sure it will not be called the Uv5R and we were told it would be a mobile unit only for starters. However, that was months back before their stock market took a dive and their release of the first Baofeng mobile analog single band unit- was less than stellar.

They might have nixed the idea of digital mobile unit- however I bet sooner or later they will jump on this to make a low cost DMR radio.

About a year ago we were told all kinds of new radios were coming out including a 8W Uv82 model (which is out) now we are being told everything is delayed or not going to be placed in production including their tri-band HT.

I had to get one (UV5R-2) to try out. The battery receiving lip on the top of the unit is a little tighter than normal UV5Rs but otherwise as far as physical characteristics I like it. The display window isn't recessed so it is going to get more scratched than the UV5R whihc has a protruding lip around it but, it feels nice in the hand and looks less blocky.

Operationally the firmware has the color changing display light which I like better than the color changing led of which it has both anyway. It programs channels as the original and comes stock with the V-85 antenna which is a nice addition. I don't know who the importer is, but overall I like it more than any of the other UV5R variants. Still no FCC type label of course.

And BTW it has the infamous Baofeng Voice Scrambler aka voice inversion.!!! Obviously there are FCC regulation discussions to be had about that, but it seems to be the same as the BF888 feature. I wouldn't use it through a repeater or you will be asking for the wrath of Hams everywhere.

Still has the horrible UV5R keyboard layout though...

That unit is very close to the TYT F9D in layout most likely a clone of it. Yes the T88 (more fancier high powered Bf888) had a voice scrambler and we found some had them that worked and others did not work.

But, it might need Part 15 certification, as most electronic devices do nowadays. That said, I do not recall if my UV-5R is so certified. IIRC, my HT had the Part 90 sticker… not that I have any need or use of Part 90 operation.

All commercially manufactured equipment (VHF/UHF) Transceivers requires at minimum Part 15 certification. This is due to certain frovisions directed at the receiver stages, especially, if the device has a scanning capability.. Look up the FCC ID on any "big 3" radio and see what it covers.

Home brew equipment is exempted from this.

I can use the TUNE feature on myPRO-106 and it will pick up thetone on it, or I can make a STALKERitem that will also find nearby
transmitters and their tones as well.
You can pick them up cheap in
areas that have gone Phase II.

that is, unless the receiver is coded to receive only certain tones from the transmitters that are of interest (groups)... otherwise, the receive tones should be turned off in the setup menu of the receiver.

Ran across this article which claims simultaneous TX/RX on the same frequency....no TDMA or such...just a different antenna pattern. Reminded me of the thread we had on this a few days ago.You could actually carry on two completely different pairs of systems on the same frequency as long as each pair had the same antenna system.

If that antenna design was so good,why isn't it in production now after10 years? Because it doesn't work.
That was a "breakthrough" from whenI was first a ham. I still don't seethem. Forget about that antenna.

I don't know if that antenna works or not (still trying to dig through that document) since I never built one but the idea is interesting. Notice, the poster said, "claims to", not "does". To answer your question, I don't think the spectrum is that crowded to need to transmit and receive on the same frequency at the same time so not too many people have built one to see if it works. Don't poo-poo something until empirical evidence shows it doesn't work. I remember an antenna that started to be popular in the 70s until some one wrote an analysis of it in QST and said it was <5% efficient and killed all interest. In rough field tests (comparative S-meter readings done by a group of hams in NJ) there was no noticeable difference between it and a quarter wave vertical. At least from the patents if that one, the inventor didn't describe exactly how his antenna worked so the analysis was based on a different mode of operation which is why it was flawed. Here a description of how it works is there, whether it's correct or not, I don't know. That's why I'm glad that some one (or several people) tested all of those rubber ducks to let the rest of us know which ones do work well. I belatedly thank him/them for their work. As the old saying goes, the proof of the pudding is in the eating.

Low band verticals can be less the 5% efficient.The less percentage of a quarter wavelength,the more capacitive (reactive) an antenna is,the less efficient it becomes and it has anarrower bandwidth due to the high reactance..

This is most often seen in mobile antennas,such as the popular screwdrivers and hamsticks. I'll be using my UV-5R to access my Echolink node,just to stay on topic. Enjoy researching antennas.It's a never-ending fascinating aspect of radio.

The comparison was between a quarter wave vertical on the roof of a car and this antenna design on the roof of a car both fed with the same power. Screwdriver antennas seem to be one of the better ones in antenna "shoot outs", ham sticks can be several db lower. I've tried most designs out there. And some that most hams wouldn't use, due to "armchair" engineers. LOL Unforch, my "mobile antenna test bed" is being junked soon (>230k miles) and the live in building inspector/ HOA (the wife) doesn't want "all those antenna and wires" in MY "new" car. (Emphasis added) so I'm building a stealth antenna based on that 70s design I mentioned. BTW, the design I'm using can and is being used on VHF and UHF and is small enough to go on the Baofeng but is so selective that it couldn't be used for repeaters unless you could instantaneously tune it between transmit and receive but great for simplex. Avoids that off channel interference which was one of its original design goals.
Antenna are an interesting aspect but can lead to flame wars too. Add them to the list of thing not to talk about on the air unless you have a "good" group. (Grin)

HI Tim:

It is certainly true that home brew gear does not need a Part 15 certification. But, manufactured gear may need it. I just checked my UV-5R… and there is that “FCC” logo inside the battery compartment.. the type usually associated with the Part 15 statement that the user of the gear must accept any unintentional signals that it receives, etc., as part of the Part 90 certification. Plus the RoHS sticker.

My kitchen radio has a Part 15 statement, and a few others. I don’t have any fully manufactured rigs, (except an FT-817 which I don’t have with me at the moment) that would need a Part 15 sticker or statement.

My XYL was a antenna hater till I talked her into getting a call of her own and then she started to carry a ht everywhere, back then cell phones were just not in this area yet and she and I could keep in touch without the landline hi hi she is now a silent key. So now I do as i want and yes my van looks like a porcupine during mating season GRIN but if she gets involved in the hobby maybe she will cut you some slack ???

If found that especially with handhelds (like our '5rs) that the receive circuitry doesn't seem to care as much as the xmit circuitry whether or not the antenna assembly is right on freq. That being said if I was setting up an antenna system for mh HH that was REALLY tight bandwidth-wise I'd set it for the xmit freq and know (or assume) that the receive would end up "close enough". Just as what happens when we build an (single) antenna assembly for the repeater itself. That said, I'm predicating the thought on the standard separation freq-wise between repeater in and out puts. Avoids that off channel interference which was one of its original design goals.Antenna are an interesting aspect but can lead to flame wars too. Add them to the list of thing not to talk about on the air unless you have a "good" group. (Grin)

Low band verticals can be less the 5% efficient.The less percentage of a quarter wavelength,the more capacitive (reactive) an antenna is,the less efficient it becomes and it has anarrower bandwidth due to the high reactance..

This is most often seen in mobile antennas,such as the popular screwdrivers and hamsticks. I'll be using my UV-5R to access my Echolink node,just to stay on topic. Enjoy researching antennas.It's a never-ending fascinating aspect of radio.

53230. New Baofeng UV-5R-2 Duplicate Firmware Incompatibility

Yahoo group: baofeng_uv5r (2015)
Date: 2015-10-10 00:03:00 UTC
From: cprendon@...
Topic: 51894 Message: 53230

So, I got a second one with exactly the same firmware, but the images are not interchangeable using Chirp. When I try to upload an image from the first into the second (or vice versa) Chrip errors with a code which is a bunch of indiscernible characters. I recall reading about this somewhere here before. If anyone knows a way around this I would appreciate it. I hate having to have multiple copies of the same configuration with different versions for each different firmware. And now for the same firmware.

The firmware messages on both are Firmware 1 = N5R2407 and 2 = BFB297.

---In baofeng_uv5r@yahoogroups.com, <cprendon@...> wrote :

I had to get one (UV5R-2) to try out. The battery receiving lip on the top of the unit is a little tighter than normal UV5Rs but otherwise as far as physical characteristics I like it. The display window isn't recessed so it is going to get more scratched than the UV5R whihc has a protruding lip around it but, it feels nice in the hand and looks less blocky.

Operationally the firmware has the color changing display light which I like better than the color changing led of which it has both anyway. It programs channels as the original and comes stock with the V-85 antenna which is a nice addition. I don't know who the importer is, but overall I like it more than any of the other UV5R variants. Still no FCC type label of course.

And BTW it has the infamous Baofeng Voice Scrambler aka voice inversion.!!! Obviously there are FCC regulation discussions to be had about that, but it seems to be the same as the BF888 feature. I wouldn't use it through a repeater or you will be asking for the wrath of Hams everywhere.

Still has the horrible UV5R keyboard layout though...

The upload will be abort if the firmware version is different or the "special block" is different. CHIRP shows you exactly what the difference. The debug.log file will also show this.

I have seen a few new radios recently have have N5R firmware but a "special block" that looks to be from a radio with BFB firmware. Cross loaded images at the factory I suppose.

The incorrect "special block" can be corrected but it takes a special CHIRP module that bypasses some of the upload protection to allow overwriting the "special block"

Completing the unpacking I see tiny differences in things like the display protective film, etc which tell me that the second was manufactured in a different lot or something from the first. So there are likely differences in the image files other than firmware itself.

That's what I would do too but the one I'm playing with might knock down the receive 20-30 db if I made one for VHF which would not work that well. Could almost use a pair for separate transmit and receive antennas for a repeater and get away with a really crappy cavity. Then I'm still amazed how you can have an HT work as a cross band repeater right out of the box.

Automatic ID? I don't follow. I'm going to take a guess and think that your talking about how is the repeater going to know that your talking to it? I guess it would just receive the signal from the "RX" side of the relay and then be transmitted to the "TX" side and into the TX radio on whatever frequency is programmed.

Has anyone tried this device yet? Does it work pretty good? I was thinking of getting one to use while camping at a certain park where my family goes. There is no cell service so it would help out a lot in communications between the 40+ members of my family. My idea of making it work better than just two portables would be to use two portables like maybe one of the HP models and hooking up each one to their own mobile antenna and sticking those antenna's on the roof of a car. Anybody have some insight on it? They're only like $20-$30 for the relay.

Yep, in the USA every licensed transmitter needs to be identified in some way.
In some applications it would be legal to ID the machine (repeater) verbally--- ie. "KB0WCE, this is AF0DJ on repeater AF0DJ-R1" . In other applications the repeater needs to be able to ID itself every x minutes of operation. (presumably so that it is never unidentified).
Commercial repeaters (for both HAM and commercial service) have these ID'rs built in.Most homebuilt ham machines also have them built in altho some machines do rely on pure verbal (operator generated) ID. Dave J

I believe any transmitter over a certain power must every so often identify itself, whether its amateur, public radio, public service, TV, etc. When you are transmitting, don’t you ID yourself every so often? The repeater must also. Morse code is still accepted to do this. Most modern repeaters have a voice chip to do this, plus other public service messages.

Bruce

I believe any transmitter over a certain power must every so often identify itself, whether its amateur, public radio, public service, TV, etc. When you are transmitting, don’t you ID yourself every so often? The repeater must also. Morse code is still accepted to do this. Most modern repeaters have a voice chip to do this, plus other public service messages. Bruce From: mailto:baofeng_uv5r@yahoogroups.com Sent: Friday, October 9, 2015 11:44 PMTo: baofeng_uv5r@...m Subject: [baofeng_uv5r] Re: Relay repeater for Baofeng Automatic ID? I don't follow. I'm going to take a guess and think that your talking about how is the repeater going to know that your talking to it? I guess it would just receive the signal from the "RX" side of the relay and then be transmitted to the "TX" side and into the TX radio on whatever frequency is programmed.

I have used the anytone repeater box (battery operated) it uses audio and two handhelds worked good even on our tiny shift on uhf cb(aus). (Not legal without license for repeaters, operators here are under a class license on uhf cb) antenna need to be vertically seperated (quite some distance) with the addition of appropriate cavities etc this box could be possibly acceptable for licensing My use was purely out of interest. Cross band was obviously better due to increased seperation of rx/tx frequencies. And then yes it would require the ident, probably a kit form or homebrew digital recorder, record the morse or phone have it activate every 10 min. As a control box i thought it worked ok. (Surprisingly well actually) Lyndsay

Let me start by reminding you that either ALL the 40+ members of your family need their own individual amateur radio licenses or you need a commercial (Part 90) license for the specific frequencies you will be using.

You will get a little added range by using car mounted mobile antennas, but not really very much added range unless you can get those car mounted antennas to a location significantly higher than where your group is.

You didn't include a link to the specific device so I can't be sure what kind of device you have in mind. There are two basic kinds of devices that attempt to extend the range available.

One kind is a controller that turns two radios into what the FCC legally calls a repeater. The problem with this kind of device is that they simply don't work unless you do one of three things: 1) Operate "cross-band"; 2) add a duplexer tuned specifically for your frequency or 3) manage to put significant separation between the receiving and transmitting antennas. Cross-band operation is the most practical method for doing this quick & cheap. The only issue with cross-band operation is that it is a bit more complicated programming the radios - and, of course, ALL the radios need to be properly programmed.

The other kind of device for extending the range among a group of radio users, needs only a single radio - it receives the audio that someone transmits, records that audio, then plays back the recorded audio on the through the same radio. These are normally called a "Simplex Repeater" although they do not need to be simplex and are not legally a "repeater" within the FCC rules. These are easy to deploy but difficult to get a group of people to use successfully without a lot of practice.

With either kind of device, the key to getting any significant increase in range is to get the antenna for the radios used with the device as high as possible. If the park is reasonably flat, 20-50 feet of elevation would be enough to make quite an improvement. That much height can be obtained by stringing up a J-pole or Slim-Jim antenna from a tall tree.

Has anyone tried this device yet? Does it work pretty good? I was thinking of getting one to use while camping at a certain park where my family goes. There is no cell service so it would help out a lot in communications between the 40+ members of my family. My idea of making it work better than just two portables would be to use two portables like maybe one of the HP models and hooking up each one to their own mobile antenna and sticking those antenna's on the roof of a car. Anybody have some insight on it? They're only like $20-$30 for the relay.

There is no requirement for automatic ID of the repeater - the control operator can do the IDing manually since there is REQUIRED to be a control operator at the repeater the entire time it is in use.

He was talking about the legal requirement that the repeater identify itself with the assigned call letters of the licensed operator responsible for the repeater. Something you would have known if you were licensed. Using anything like this device without a license is a criminal offense in the United States, good for several thousand dollars in fines for each day of illegal operation if you get caught. And the kind of operation you are describing is an excellent way to get caught.

They have a Morse Id unit out but the combo of the pocket repeater module and ID unit is much more than the $25 listed here. I cannot remember the brand or link for it- will look. We sold these $120 duplex and simplex repeater modules at one time. However, after repeated failures to get them to work right with users, phone calls and being used for illegal operations I decided to stop selling them.

We originally got them for the US Army as portable extenders to be used in reserve training.

Yep, in the USA every licensed transmitter needs to be identified in some way.

In some applications it would be legal to ID the machine (repeater) verbally--- ie. "KB0WCE, this is AF0DJ on repeater AF0DJ-R1" .

In other applications the repeater needs to be able to ID itself every x minutes of operation. (presumably so that it is never unidentified).

Commercial repeaters (for both HAM and commercial service) have these ID'rs built in. Most homebuilt ham machines also have them built in altho some machines do rely on pure verbal (operator generated) ID.

I've run a few repeaters in days past w/o duplexers. That being said, our assigned freqs were slightly more than 4.25 MHz apart, we kept the output below 45 watts, and we still needed at least 90 feet of separation to avoid all de-sense.Obviously the freqs were NOT in the amateur band but did straddle the 2 meter one.
We find our repeaters on those freqs work MUCH better with a good set of 4 cans
6 cans do a great job if using the common 600KHz offset for 2 meter ham use. Dave J AF0DJ

Desensitization of the reciever is inevitable at high tx power (especially our UV5R as it is not selective by any measure), cavities and a single antenna are the go for same band operation. In Australia auto ident is compulsory for ham and cb repeater though i do not see the same requirements for commercial land mobile pls correct me if necessary The ability to control uhfcb repeaters ie switching on/off via ctcss or other means is a sick bird in Aus. I love my UV5R, tough efficient, very sensitive. Even the much maligned led is great Saved my butt that led :) Lyndsay

uhhh.... control operator AT the repeater ????

Don't you mean that the control operator has to be at the repeater or able to remotely control it?

BUT ANYWAY.... there is a nice solution out there to build your own repeater, and it's really not too hard to do. Just build yourself an AllStar node out of a Beaglebone black or a Raspberry Pi 2 (has to be the 2). Make a simple USB URI (Universal Radio Interface), and BAM you have a repeater which is fully legal, it identifies by either CW or Voice, and is able to be shut down remotely, etc etc etc...

Believe it or not, this can be done with two Baofengs, some Coax, and a little time with a soldering Iron.

NUMEROUS links there on how to take the COR off a BF-F888, and I think you could find one on the UV-5R. The audio needs to be stepped down using some resistors, but other that that if you want a really cool electronics project to learn on it's what I recommend.

It gave the error format it would for a firmware mismatch but the data string was a bunch of strange characters, all the same "Image not supported by radio" followed by a string of rectangles with Xs in them. So I guess that means a special block mismatch since the firmware is the same. I captured the debug log if you want to take a look at it. I looked at it and I don't know what to look for in the hundred of lines of info.

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

The upload will be abort if the firmware version is different or the
"special block" is different. CHIRP shows you exactly what the
difference. The debug.log file will also show this.

I have seen a few new radios recently have have N5R firmware but a
"special block" that looks to be from a radio with BFB firmware. Cross
loaded images at the factory I suppose.

The incorrect "special block" can be corrected but it takes a special
CHIRP module that bypasses some of the upload protection to allow
overwriting the "special block"

Actually where it significantly extends range is if person A is at a bearing of 0 degrees and person B is at a bearing of 180 degrees you have much more range than if they were in a simplex straight line. That is how campers tend to use these, Place it in a base camp position and them as people fan out from there they have a better chance of reaching each other. Of course if they all go in the same direction, the repeater is useless.

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote :

Let me start by reminding you that either ALL the 40+ members of your family need their own individual amateur radio licenses or you need a commercial (Part 90) license for the specific frequencies you will be using.

You will get a little added range by using car mounted mobile antennas, but not really very much added range unless you can get those car mounted antennas to a location significantly higher than where your group is.

You didn't include a link to the specific device so I can't be sure what kind of device you have in mind. There are two basic kinds of devices that attempt to extend the range available.

One kind is a controller that turns two radios into what the FCC legally calls a repeater. The problem with this kind of device is that they simply don't work unless you do one of three things: 1) Operate "cross-band"; 2) add a duplexer tuned specifically for your frequency or 3) manage to put significant separation between the receiving and transmitting antennas. Cross-band operation is the most practical method for doing this quick & cheap. The only issue with cross-band operation is that it is a bit more complicated programming the radios - and, of course, ALL the radios need to be properly programmed.

The other kind of device for extending the range among a group of radio users, needs only a single radio - it receives the audio that someone transmits, records that audio, then plays back the recorded audio on the through the same radio. These are normally called a "Simplex Repeater" although they do not need to be simplex and are not legally a "repeater" within the FCC rules. These are easy to deploy but difficult to get a group of people to use successfully without a lot of practice.

With either kind of device, the key to getting any significant increase in range is to get the antenna for the radios used with the device as high as possible. If the park is reasonably flat, 20-50 feet of elevation would be enough to make quite an improvement. That much height can be obtained by stringing up a J-pole or Slim-Jim antenna from a tall tree.

Has anyone tried this device yet? Does it work pretty good? I was thinking of getting one to use while camping at a certain park where my family goes. There is no cell service so it

would help out a lot in communications between the 40+ members of my family. My idea of making it work better than just two portables would be to use two portables like maybe one of the HP models and hooking up each one to their own mobile antenna and sticking those antenna's on the roof of a car. Anybody have some insight on it? They're only like $20-$30 for the relay.

Mmmmmm. Not necessarily. If the repeater is on high ground it can link anyone in line of sight. You could be down a hole and unable to talk to someone fairly close on level ground, but if both can ‘see’ the repeater – well, I’m sure you see what I mean.

53276. Re: Relay repeater for Baofeng

Yahoo group: baofeng_uv5r (2015)
Date: 2015-10-10 13:48:30 UTC
From: n7kuw@...
Topic: 53233 Message: 53276

To summarize what many have posted:

1. No, it won't work unless you (a) have the two radios a long ways apart (hundreds of feet) or (b) use a device called a duplexer. Otherwise, the transmitting radio will interfere with the receiving radio. Your effective range for the repeater will be a few feet at most.

2. There are many questions regarding the legality - what frequencies you will be using, how they are licensed, etc. Pretty much a non-issue though because of item 1 - it won't work anyway.

3. Even if you are using properly licensed frequencies, there are other legal issues, including being able to maintain proper control of the transmitter either by local or remote control, which this repeater configuration does not do (unless there is someone physically at the repeater whenever it is in use).

A used duplexer that can handle a 600 KHz split will typically cost you hundreds of dollars. A new one well over $1000.

A proper repeater controller will cost you well over $100.

And if you are going to spend that much money to build a repeater, then buy a radio that has a duty cycle that can handle the job - a Baofeng won't last long in repeater operation.

53280. Re: [baofeng_uv5r] Relay repeater for Baofeng

Yahoo group: baofeng_uv5r (2015)
Date: 2015-10-10 05:29:01 UTC
From: R Pryor MAEd CETsr
Topic: 53233 Message: 53280

Also I can imagine what type of duty cycle two $30 Baofeng;s are going to be under to extend 40 members.

FYI the Oathkeeper group here tried this and burned up both uv5R radios using the higher quality Radio Tone versions.

These really are designed for short messages lasting a few seconds with a less than 50% DC if using a uv5R platform.

Subject: Re: [baofeng_uv5r] Relay repeater for Baofeng

Let me start by reminding you that either ALL the 40+ members of your family need their own individual amateur radio licenses or you need a commercial (Part 90) license for the specific frequencies you will be using.

You will get a little added range by using car mounted mobile antennas, but not really very much added range unless you can get those car mounted antennas to a location significantly higher than where your group is.

You didn't include a link to the specific device so I can't be sure what kind of device you have in mind. There are two basic kinds of devices that attempt to extend the range available.

One kind is a controller that turns two radios into what the FCC legally calls a repeater. The problem with this kind of device is that they simply don't work unless you do one of three things: 1) Operate "cross-band"; 2) add a duplexer tuned specifically for your frequency or 3) manage to put significant separation between the receiving and transmitting antennas. Cross-band operation is the most practical method for doing this quick & cheap. The only issue with cross-band operation is that it is a bit more complicated programming the radios - and, of course, ALL the radios need to be properly programmed.

The other kind of device for extending the range among a group of radio users, needs only a single radio - it receives the audio that someone transmits, records that audio, then plays back the recorded audio on the through the same radio. These are normally called a "Simplex Repeater" although they do not need to be simplex and are not legally a "repeater" within the FCC rules. These are easy to deploy but difficult to get a group of people to use successfully without a lot of practice.

With either kind of device, the key to getting any significant increase in range is to get the antenna for the radios used with the device as high as possible. If the park is reasonably flat, 20-50 feet of elevation would be enough to make quite an improvement. That much height can be obtained by stringing up a J-pole or Slim-Jim antenna from a tall tree.

Subject: [baofeng_uv5r] Relay repeater for Baofeng

Has anyone tried this device yet? Does it work pretty good? I was thinking of getting one to use while camping at a certain park where my family goes. There is no cell service so it would help out a lot in communications between the 40+ members of my family. My idea of making it work better than just two portables would be to use two portables like maybe one of the HP models and hooking up each one to their own mobile antenna and sticking those antenna's on the roof of a car. Anybody have some insight on it? They're only like $20-$30 for the relay.

Topic: 53233 Message: 53281

We had probs with noise and the separation factor as you mentioned. It really never worked well for a difference in extended range close together. The Baofeng wide open front end made it undesirable to run properly for duplex work without some issue.

UHF with a really wide separation (like what others mentioned) seemed to give better results. The way to do this for some type of limited operation would be cross banding, large separation distances at the highest point with Yagi dedicated antennas for directivity and gain. Anything else was noisy, gave a few extra miles at the best and needed a control operator at the point.

More then 3 people on the repeater caused heat issues too. My biggest reason for NOT selling them was the legality issues as I sensed they would be used for something not Part 97 kosher.

The Simplex parrot model (still annoying) was a better choice as it used a store and forward type of operation allowing it to transmit only on carrier drop improving the operation of the units. It also had a fixed TOT to keep long transmissions low, and the parrot repeat allowed the operator to hear the quality right away without duplexing. However, the repeat gets annoying and is good for 2 people use or/ an extended range back to base camp with the end users just monitoring only.

We had stuff that costs over $100, I can imagine what a $25 unit would do. But who knows maybe a good item for limited use in a bug out bag if in the mountains .

The US Army reserve used both types, mostly to extend for monitoring only (1 way comms) with very short duty cycles and transmissions.

Subject: Re: [baofeng_uv5r] Re: Relay repeater for Baofeng

I've run a few repeaters in days past w/o duplexers.
That being said, our assigned freqs were slightly more than 4.25 MHz apart, we kept the output below 45 watts, and we still needed at least 90 feet of separation to avoid all de-sense.
Obviously the freqs were NOT in the amateur band but did straddle the 2 meter one.

We find our repeaters on those freqs work MUCH better with a good set of 4 cans

6 cans do a great job if using the common 600KHz offset for 2 meter ham use.

The video is a FAKE -- without a duplexer or SIGNIFICANT separation, the "transmitting" radio would be completely blocking the receiving radio.

53282. "New" Baofeng? UV-B5,6 is unknown?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-10-10 15:33:15 UTC
From: mike@...
Topic: 53282 Message: 53282

I have read a LOT of comments of the "new" radios, but no one has mentioned what I have termed as NEW series of handheld radio from Baofeng; -It is the UV-B5 and UV-B6.

I had a UV-B5 at first, but found that the rotary encoder (knob) was problematic, as I had read. I returned this unit, and got the UV-B6, which has no "extra knob," and in it's place, the LED has returned in place of the rotary knob.

I have had many (five?) of the UV-B5 radios, progressing up the releases with the quest of getting better TRANSMIT AUDIO. It was very hard to get 4 Khz of transmit deviation with all, if I used the internal mic of the radio. (An external mic in any form did not have this issue!) This measurement is referenced to my three service monitors, not just an "opinion."

I have found that the UV-B5 and '6 both have very good transmit audio! Plus the audio is a lot "fuller," due to a better audio bandwidth. The metering is better and the receiver is a LOT (!) better in high-RF environments, compared to all of my past UV-5. I think I paid $26 or $27 for the radio from Amazon. Hard to beat! This is really a great improvement over the function of the earlier series, whose upgrades were largely cosmetic.

I've done cross band repeat with my oldKenwood true dual band mobile. That hasreal receivers that don't get overloadedwhen you cross band as long as your 2 meterfrequency and your 440 are not exact 3times multiples. That radio had separate2 meter and 440 antenna outputs. My newerIcom true dual band only has one antenna.On multiband repeaters, I can hear myselfcoming back on 440 while I'm transmittingon 2 meters. It's the ultimate talk back ;-)

With all the various uv5 pocket repeater projects I have done.
Here are some info.

1. If you are going to have more than 3 users or talk with a high duty cycle of operation do not use the uv5R repeaters
2. If you are NOT going to crossband- do not use the uv5R repeaters.
3. If you want something with range and reliability Do not use the uv5R repeater
4. If you want something legal- most likely do not use the uv5R repeaters

If you want to learn about repeaters, are going hiking or camping for a weekend and want some type of extra safety measures (and know what you are doing) or you like to tinker with Ham radio and electronics The Uv5R repeaters maybe a good choice.

better choices

Wouxun 8D with a decent antenna and bigger battery used at a prime location.

Best choice 1

Car mobile at basecamp with good power source, (one that has crossband repeat) matched antenna in a prime RF location paired on frequencies that will not cause interference. With a control operator at the base camp. Good cooling fans, and operators with operational skill. Operators and users all licensed.

Automatic ID? I don't follow. I'm going to take a guess and think that your talking about how is the repeater going to know that your talking to it? I guess it would just receive the signal from the "RX" side of the relay and then be transmitted to the "TX" side and into the TX radio on whatever frequency is programmed.

uhhh.... control operator AT the repeater ????

Don't you mean that the control operator has to be at the repeater or able to remotely control it?

BUT ANYWAY.... there is a nice solution out there to build your own repeater, and it's really not too hard to do. Just build yourself an AllStar node out of a Beaglebone black or a Raspberry Pi 2 (has to be the 2). Make a simple USB URI (Universal Radio Interface), and BAM you have a repeater which is fully legal, it identifies by either CW or Voice, and is able to be shut down remotely, etc etc etc...

Believe it or not, this can be done with two Baofengs, some Coax, and a little time with a soldering Iron.

What we did was use a Yagi direction we constructed from a kit with Gamma matches- Here is a great antenna for those wanting a uv5R priced antenna that gives 1.2 VSWR when matched.

http://www.szanysecu.com/Products/Products/Yagi

The Yago was pointed in the direction of the hike trails and valley.

We found we did not need a repeater as the Yagi was able to do the job very well extending the range.

This might be a better solution for those that hike and camp in areas where cell phone coverage is not good.

Actually where it significantly extends range is if person A is at a bearing of 0 degrees and person B is at a bearing of 180 degrees you have much more range than if they were in a simplex straight line. That is how campers tend to use these, Place it in a base camp position and them as people fan out from there they have a better chance of reaching each other. Of course if they all go in the same direction, the repeater is useless.

And then there is that simplex repeater idea. I have a couple of them from days past that I bought at Radio Shack. The cables they supply to connect to the rig (an HT is assumed) would not mate with the UV-5R, but do work with Icom and other rigs. It would not be difficult to make a new cable, or get appropriate adapters.

If the communication needs are modest, a simplex repeater might do the job. The Radio Shack units record up to 30 seconds of audio, as received by the HT, via the headphone jack. The, the same audio clip is sent down the cable to the HT’s mic input (with proper audio level for a mic input), while actuating the PTT circuit on the rig.

It’s simple to use (no adjustments).. and requires only one rig to operate. And, no duplexer. One possible setup would be to put the rig and “repeater” on the top of a pole, to give the unit more height (coverage area). The repeater is powered by internal batteries.

You believe wrong. Power output has nothing do do with it.
Different radio services and different types of transmitters have
different station identification requirements. In some cases station
identification is not required at all. The station identification
requirements are spelled out in the ruled parts or subparts for each
radio service.

You (and probably he) took it harsh, but I was speaking literally -- ignorance is simply the lack of knowledge, which is exactly the problem when someone proposes simply connecting the earphone level audio output of one of these radios directly to the microphone level audio input of another one of these radios and expects the VOX to magically turn it into a working repeater.

There is a world of difference between ignorance (which can be cured) and stupidity (which cannot) -- unfortunately we often see ignorance mixed with arrogance which makes the ignorance incurable.

Well actually you can do it alot cheaper without ordering this thing i just figured out.
All you need is a 3.5mm AUX cable to plug into the "RX" radio and an adapter for a 2.5mm and plug it into the mic port for the "TX" radio and tada!

> uhhh.... control operator AT the repeater ????

That is what I said.

> Don't you mean that the control operator has to be at the repeater or able to remotely control it?

And with any of the methods discussed in this thread, there is NO legal way to "remotely" control the repeater -- hence, the control operator must be in a position to at least shut down the repeater -- that puts the control operator in a position where he can easily ID the repeater, although there is actually no requirement that the ID be sent from the repeater itself. A repeater can be ID'ed over the air by any of the users so long as the time requirements are met.

> BUT ANYWAY.... there is a nice solution out there

Legal doesn't seem to matter much to someone who is already illegally operating the radio without a license.

"Easy" is not likely to describe anything that begins with "Just build yourself...." when you are talking about someone who thinks they could just plug the earphone level audio output of one radio into the microphone level audio input of another radio and rely on VOX for everything else.

The UV-B5 and B6 have been out for many years. Definitely not new.

The "simplex repeater" works great with a small group of well trained individuals with some discipline -- the only issue with a simplex repeater and the UV-5R is, of course, the duty cycle. Any simplex repeater will experience relatively long periods of peak 50% duty cycle. The UV-5R radios vary quite a bit from one radio to the next, but most can survive a 50% duty cycle for more than a few minutes only on low power.

The big problem with simplex repeaters is not the radio but the users. What almost always happens is that User A transmits his important message and User B hears User A directly so User B responds as soon as User A finishes talking. This results in User B and the simplex repeater both transmitting on the same frequency at the same time, which may result in no one hearing User B, or worse, User A hears User B (due to FM capture effect) while everyone else hears the simplex repeater parroting what User A had said. Now several other users try to respond to User A at the same time that User A is trying to respond to User B. From this point, things really get bad.

And then there is that simplex repeater idea. I have a couple of them from days past that I bought at Radio Shack. The cables they supply to connect to the rig (an HT is assumed) would not mate with the UV-5R, but do work with Icom and other rigs. It would not be difficult to make a new cable, or get appropriate adapters.

If the communication needs are modest, a simplex repeater might do the job. The Radio Shack units record up to 30 seconds of audio, as received by the HT, via the headphone jack. The, the same audio clip is sent down the cable to the HT’s mic input (with proper audio level for a mic input), while actuating the PTT circuit on the rig.

It’s simple to use (no adjustments).. and requires only one rig to operate. And, no duplexer. One possible setup would be to put the rig and “repeater” on the top of a pole, to give the unit more height (coverage area). The repeater is powered by internal batteries.

I agree completely. A simplex repeater requires well-disciplined operators… i.e. wait for, say, five seconds or so, before attempting to make a response. And, certainly, with the UV-5R, all transmissions should be kept short. Even 30 seconds may be pushing the limit way too much.

I used my repeater once upon a time with a Radio Shack HTX-202. Worked fine there, but that radio has a decent metal case (heat sink) on the back.

I was not referring to any type of cross band repeating. The linked video specifically referred to a 600 KHz split on VHF using two Baofeng's (although it was not in the amateur 2 meter band). In-band repeating with two radios sitting side by side without a duplexer, spaced 600 KHz apart in frequency, won't work.

Experience has shown that to be VERY true even with the best (and most selective) of receivers available in todays market. Maybe some day in the future perhaps with SDR systems it may be possible. Today not so much so. Dave J

In the USA, a ham radio license consist of two parts, a station license and an operator license. It is one document, but is in two parts.. Both are required to operate a ham station of any type/freq/power/location..

A ham radio repeater must belong to one station license, and must be identified by that station call sign at least every ten minutes. Part 95 requires that all transmitters be monitored at all times, and a licensed control operator have control of the repeater at all times. Most ham repeaters have remote control which may consist of radio links with tone controls, or direct telephone line connection with tone control to the repeater control board, to shut down the repeater transmitter if necessary to stay within the part 95 rules and regulations.

The call sign of the repeater must belong to the ham radio operator that has total responsibility for correct operation of the repeater and is totally responsible to the FCC if the repeater is operated outside part 95 of the FCC rules and regulations. This includes people using the repeater who do not have a correct ham radio license to operate on the repeater freqs.. (one of the reasons that a control op must monitor the repeater at all times that the repeater is in operating mode.

Most UHF/VHF repeaters have an integrated control board that gives the control op total control of the repeater at all times. These boards are expensive.

And, the repeater freq allocation committees, which are volunteers, get upset when a repeater suddenly shows up on a freq that interferes with a properly freq coordinated repeater. As that falls under the same part 95 rules and regulations that require all ham radio stations do not interfere with an ongoing communication between licensed hams.. These committees have direct communication with the FCC and have some recommendation authority as to what the FCC needs to investigate.

These $20 Chinese wonders can cause considerable pain and tribulation to those that mis-use them. Up to, and including prison time and becoming homeless to pay the fines to the federal government.. and the federal government has ways to collect moneys that the courts rule belong to them...

Unless you are licensed to operate on some freq that these radios will operate, my suggestion is that you disable the transmitter, or give it to someone that you dislike.

Ham radio is FCC Part 97, not Part 95 (MURS, FRS, GMRS, CB). The control operator does NOT need to monitor 24 hours per day, otherwise they could not work or sleep. It can be under automatic controlled. It must be id'd only every 10 minutes while in use.

my apologies Jardy for confusing part 95 and part 97 of the FCC rules and regulations.. sometimes errors are made when a person is tired and sleepy, or just sloppy..

but thanks for bringing it to my attention.. and especially to Scott who was kind enough to send a pm to let me know of my mistake.

But, all ham radio transmissions are still the responsibility of the license holder of the call sign used. If you cannot monitor the transmitter 24/7 then you might want to get some help, or only operate the repeater when you can monitor it.. I know that the rules are sometimes very loosely interpreted by operators and usually get by with operating illegal until a major occurrence or the transmitter interferes with some government or business operations.

For example, your 20$ repeater goes crazy (or possibly a design flaw) and transmits on the USA aircraft transponder freq, you probably will get a visit from either the FAA or FCC in a little while. The aircraft emergency transponders that are used to detect aircraft crashes are monitored by satellite and will detect a very faint signal being transmitted and can be located via GPS very precisely.

I know several people that own numerous repeaters. It would be impossible fir them to monitor all at the same time all the time. It is not an FCC requirement.

Also, they stopped monitoring the 'aircraft transponder' frequency by satellite many years ago. While the frequency is still active, it is mostly monitored by flying aircraft, or in my location, we have a repeater that monitors the ELT frequency of 121.5. In WA state, the Dept of Transportation Aviation Division is responsible for finding these when active. I am one of 2 people authorized by that Division to be in charge of looking for these in this area. So far, we have found around 50 of them in the past few years.

I have a GMRS license and the area where we are going to be camping does not have good service. Using two portable radios at 4 watts probably won't effect the closest Amateur repeater which is 13 miles away on the 443mhz and 147mhz if i am using the GMRS freqs of 462/467mhz. The park were going to be at is a very bad location. Where were going to be sleeping is up on a hill and there is a pond that is about 1.5 miles away down the hill in a valley. So im not really worried about it interfering with other systems just because its in a terrible location. I dont think the system will get out any more than a 1 mile

Only problem is Baofengs are not legal on GMRS in any way, shape, or form.

> I have a GMRS license and the area where we are going to be camping does not have good service. Using two portable radios at 4 watts probably won't effect the closest Amateur repeater which is 13 miles away on the 443mhz and 147mhz if i am using the GMRS freqs of 462/467mhz. The park were going to be at is a very bad location. Where were going to be sleeping is up on a hill and there is a pond that is about 1.5 miles away down the hill in a valley. So im not really worried about it interfering with other systems just because its in a terrible location. I dont think the system will get out any more than a 1 mile

In the US, most licensed hams who realize that there ARE any regulations would also know which Part contains those regulations (Hint: It AIN'T Part 95) But other than that, your comments are generally correct.

From: mailto:baofeng_uv5r@yahoogroups.com

In the USA, a ham radio license consist of two parts, a station license and an operator license. It is one document, but is in two parts.. Both are required to operate a ham station of any type/freq/power/location..

A ham radio repeater must belong to one station license, and must be identified by that station call sign at least every ten minutes. Part 95 requires that all transmitters be monitored at all times, and a licensed control operator have control of the repeater at all times. Most ham repeaters have remote control which may consist of radio links with tone controls, or direct telephone line connection with tone control to the repeater control board, to shut down the repeater transmitter if necessary to stay within the part 95 rules and regulations.

The call sign of the repeater must belong to the ham radio operator that has total responsibility for correct operation of the repeater and is totally responsible to the FCC if the repeater is operated outside part 95 of the FCC rules and regulations. This includes people using the repeater who do not have a correct ham radio license to operate on the repeater freqs.. (one of the reasons that a control op must monitor the repeater at all times that the repeater is in operating mode.

Most UHF/VHF repeaters have an integrated control board that gives the control op total control of the repeater at all times. These boards are expensive.

And, the repeater freq allocation committees, which are volunteers, get upset when a repeater suddenly shows up on a freq that interferes with a properly freq coordinated repeater. As that falls under the same part 95 rules and regulations that require all ham radio stations do not interfere with an ongoing communication between licensed hams.. These committees have direct communication with the FCC and have some recommendation authority as to what the FCC needs to investigate.

These $20 Chinese wonders can cause considerable pain and tribulation to those that mis-use them. Up to, and including prison time and becoming homeless to pay the fines to the federal government.. and the federal government has ways to collect moneys that the courts rule belong to them...

Unless you are licensed to operate on some freq that these radios will operate, my suggestion is that you disable the transmitter, or give it to someone that you dislike.

Hi Barry,

Thanks for that OM, I should have put that in.

At 12:29 PM 6/10/2015, you wrote:

> Power is limited to ten watts maximum regardless of emission mode used.

Incorrect. 10 watts PEP which is around 3 watts AM and FM.

My apologies, I neglected to put PEP in the sentence, however, that really impacts AM or SSB – frequency modulation doesn’t alter power output – so PEP and Mean Power are essentially the same in that mode, so a 10w or less FM Xmiter is legal for a Foundation Licensee as I understand it, otherwise even a 5w BaoFeng would be too much. I’m pretty sure that’s not the case, or am I misinterpreting? If I am, so are a LOT of other people.

EPIRBs and ELTs in Oz are now required to be of the 406Mhz variety. The SARSAT no longer listens for 121.5/243mhz beacons, AFAIK, there are no monitored receivers for that type anymore, not sure who'd be likely to hear it, domestic aircraft haven't ever been required to routinely listen on 121.5 as far as I can remember, they'd just be asked to if an aircraft went missing. 'Searchmaster requests that you listen on 121.5 for an ELT, advise on this frequency if anything heard'.

AFAIK, if you are in the DRA (Designated Remote Areas) over water or otherwise required to have/carry an embedded or portable ELT, it must be of the 406mhz variety, the 121.5/243 version are officially obsolete now, at least for aircraft, think you can still carry them and use them, but you must have a 406mhz one as well to be compliant.

I know several people that own numerous repeaters. It would be impossible fir them to monitor all at the same time all the time. It is not an FCC requirement.

Also, they stopped monitoring the 'aircraft transponder' frequency by satellite many years ago. While the frequency is still active, it is mostly monitored by flying aircraft, or in my location, we have a repeater that monitors the ELT frequency of 121.5. In WA state, the Dept of Transportation Aviation Division is responsible for finding these when active. I am one of 2 people authorized by that Division to be in charge of looking for these in this area. So far, we have found around 50 of them in the past few years.

The U.S. Does not require 406 yet, but strongly suggests it. Funny thing is, most 406 ELTs still use 121.5 on very low power to help home in. EPIRBs and Mountain Locator Beacons and I believe Spot still use 121.5 heavily in the U.S. The FCC said to drop it, the FAA said no.

True statement... Chased the old 121.5/243.0 variety for years in CAP with an L-Per (www.ltronics.com).
Domestic military aircraft routinely monitored 243.0 since it was built into the switch for dual freq monitoring; an additional selection for NOT listening to "Guard." I was USAF and we called it "Navy Common." I suspect the squids had an equal nomenclature for the "Airheads." FYI www.cospas-sarsat.int and www.sarsat.noaa.gov regarding what Geoff said...
Does anyone routinely enter 406 into their UV5 programming? Toby KD5QWQ

HI Bobbie:

My understanding of the current rules is that “automatic control” is permitted. Mainly, that means a 3-minute transmission timer that will stop the transmitter from continuous transmission. Remote control via RF is often done, but for systems operating on VHF, the repeater’s input frequency cannot be use for control purposes as well. You need a separate system for control.

Many automatic systems have a control operators monitoring the repeater, especially club repeaters and private repeaters.
But, it’s not 24/7. Some systems do shut down overnight, but use some means of restoring normal operation, should the need arise in the wee hours, like the “long-tone-zero”….
(keypad DTMF zero, for 5 seconds or more.. or methods like that).

These days, quality repeaters are on a par (or better than) commercial installations, and can operate properly for long periods with little attention. This does not relieve the repeater owner (a ham or club) from responsibility for proper operation, but the fact is that many systems are -always- in proper operation, with periodic maintenance and testing for compliance, using commercial grade test gear.

Of course, this would exclude a UV-5R pair, hooked up as a repeater.

53316. 406 MHz ELT/EPIRBs

Yahoo group: baofeng_uv5r (2015)
Date: 2015-10-11 15:55:03 UTC
From: Tom Consodine ND5Y
Topic: 53233 Message: 53316

Contrary to what is commonly posted on the internet, by morons in most cases, ELTs ane EPIRBs do not operate on 406.0 MHz.

Those who are interested in the exact frequencies should refer to Table H.2 Cospas-Sarsat 406 MHz Channel Assignment Table which is on page 218 of:

COSPAS-SARSAT 406 MHz FREQUENCY MANAGEMENT PLAN C/S T.012 Issue 1 – Revision 10 October 2014

Here is a link to the document.
http://www.cospas-sarsat.int/images/stories/SystemDocs/Current/T012-OCT-2014.pdf

If you want details of the data transmission format and modulation refer to:

SPECIFICATION FOR COSPAS-SARSAT 406 MHz DISTRESS BEACONS C/S T.001 Issue 3 – Revision 14 October 2013

and here is a link to that document.
http://www.cospas-sarsat.int/images/stories/SystemDocs/Current/cs_t.001_oct_2013.pdf

And simply listening for a signal on the 406.xxx MHZ ELT/EPIRB freqs isn't going to do much good...grin. The transmissions there are very short "burst" transmissions carrying data up to the satellite systems for downlinking into controlling SAR ground stations. Either aircraft N number or vessel name, where based, colors, owner's name and phone numbers, alternate contact info, etc.In many cases the exact GPS (D/M/S) location is included in the data burst depending on whether or not the device has a GPS receiver (slightly more expensive)-("slightly" in comparison to funeral expenses -- sad grin).
As has been reported here already, yes, a small 500 MW (average) 121.5/243 signal is also generated for close in homing. I believe the 243 is still approx half of the vhf power as it's simply an additional passive doubler circuit in the output.
By the way, as a boat owner I was informed by the US Coast Guard once that I had to remove my old 121.5 EPIRB from the boat or be cited for having it aboard. They REALLY are trying to get the old 121.5 stuff out of circulation. I do now have a registered, GPS coupled, 406.xxx Meg set. aboard and do have to update the free registration bi-annually :-)
LTronics is still making a good VHF DF set, much more wide-banded than the previous ones (LilElpers) that will cover some of the VHF LMR freqs as well as the aviation ones. Unfortunately as we all know with increased bandwidth comes decreased sensitivity and receiver range so it's not quite as "range capable" as the old "box on a cross" set.
Becker is another company make a DF set for mounting in aircraft. That's the "coffee can" looking device mounted under a lot of the red and white CAP aircraft these days. The becker gives the aircrew observer a strobe indication of the actual bearing from the aircraft to the target when the 406 MHz burst is received. VERY handy. Dave J AF0DJ // Grasslands 44 CAP communicator since 1958Recreational sailor since 1960USAF retired

The UV-82 series is probably the best of the Baofeng family of radios.

Yes in my opinion a better radio than the uv5R. Mostly problem free.

The disadvantages are the accessories for them are limited- no extended battery, AA or AAA packs.

The biggest selling point of the uv5R’s are the 3800 extended batteries.

Baofeng /or other could design a Wouxun styled bigger battery by making it slightly fatter for the Uv82’s

Here is the problem with the HP versions, A58’s and others.. Most Baofeng types do not want to spend above $40 for a Baofeng radio. (Some even above $30.)

So for a seller item many feel 8W is not worth the increase in price, in my opinion having the newer versions is worth it if buying from a reputable source.

53324. Can't switch to the FM broadcast band

Yahoo group: baofeng_uv5r (2015)
Date: 2015-10-11 21:38:52 UTC
From: w1aex.fn31@...
Topic: 53324 Message: 53324

After a couple of years of use my UV5R can no longer switch to the FM broadcast band. When you tap the CALL button the Baofeng girl simply says "Cancel". If you hold the CALL button long enough it does initiate the ALARM sequence as expected. Any thoughts?

Xaun, I suppose that you have not made mistakes, judging from your previous post.

It is good that at least one perfect person is posting on this forum.

I suppose that there are some hams in the US that don't know that there are rules and regs for ham radio. And I suppose that there are some people throughout the world that think they know all there is to know about everything. I have met a few know-it-alls, and feel that I have found another..

Most people on this forum would appreciate you keeping your unsavory thoughts to yourself and stop showing the world that you are extremely egotistical.

No doubt that you are an intelligent person, but severely lacking in social skills.

So, please tone it down.

Thanks for the little bit of magic Jim. Everything is as it should be with the UV5R-2 radios now. I still prefer the UV82s, most of the time but these are a bit of an improvement over the UV5Rs. The UV82s feel more like your average Commercial Radios I am accustomed to. They are about a pound shy and 2/3 the size, but closer. Can we say Mot.....

Rob,

You or someone else has most likely disabled the feature in software.
This can be done with the OEM or CHIRP (and probably other)
programming software.

From: willt9000@...
Topic: 53334 Message: 53334

Found this on another email list server. Credit to W7PWP

.....taking apart a Baofeng is not the best idea in the world.. they never go back together the same way; $40, what do you expect !!! I found you can remove the battery, antenna, volume knob and nut, then turn the radio so that the LCD display is UP and spray into the shaft and around ...use as little as possible ...you don't want the contact cleaner getting in to the LCD ...this solves the issue ...did it with the LCD down; took 6 mo. for it to read right again....

From: Jim Unroe
Topic: 53346 Message: 53353

Michael,

For over three years the default was that manually entered channels had the scan_add bit enabled. So this meant that these channels were always added to the scan list. The only catch was that the scan list was only built when the radio was powered on or rebooted. So after you added some channel in a manual programming session, you had to power cycle the radio to add them to the scan list and then they would be scanned.

But, either by accident or on purpose, some recent Baofeng models have been shipping with the default so that manually entered channels have the scan_add bit disabled. So newly added channels will not be added to the scan list and, unfortunately, they can not be scanned.

As mentioned earlier, the only way to scan channels on radios with this firmware coded configuration is to use software to enable the scan_add bit.

Jim KC9HI

Scott is correct. It can be done through programming software only. Just one of the many "perks" in Baofeng firmware.

Brian,

You work for a department right? LAPD generally is in the 506 range but digital with encryption. I cannot tell the others from the Alpha tags (no freqs listed) but the offsets are all public service and I think a couple are for LASD.

You do not want offsets or tones put in your radio unless you work for a department.

Also some of the info on RR for the tones are not always correct especially for LA. If you work for a department the comm center should have the updated tone settings or you can sniff a service radio and get them too.

Yes I noticed only LAPD and some LASD offsets and jumped to the conclusion it was LA PD (Los Angles) that you needed.

Sorry for that.

The LA area has gone through a large amount of frequency changes since the beginning of the year- especially the PS pool. We had to reprogram our settings here to keep up with it.

Hi Scott,

Let your friend know that he can use any N5R34xx file to perform the recovery. It is only the "main" memory that needs to be restored. The "aux" memory that gets skipped should still be untouched.

Just have him to use the CHIRP daily-20140714 build to perform the recovery

Your friend wouldn't have been able to do this if he would have been using a recent CHIRP daily build, so once the restoration is successful, be sure to have him upgrade to the latest daily build.

Scott,

Neither of these radios has had a N5R34xx file uploaded it it. They have two memory areas corrupted corrupted by upload an image file from a radio with BFB firmware. I can repair these and email them back or you can use a factory image.

Answer me this, you aren't uploading the "factory" image and then uploading the "bad" image again, are you?

Just a note, the RT software is Windows based. For those using MACs… Chirp does the trick.

I'm relatively new to the Baofeng world and I have a firmware question. Today I received a unit labeled
UV-5R-2 with a firmware of N5R2407 and BFB297. I was wondering, is this old firmware, new or what?

Thanks,

Bill WB4WTN

You had given me a 3409 before but it had some places that I didn't like so I figured I would hold it back. This one looks great so it has been posted. Thanks.

I'm surprised that Baofeng when from 9 to A (3409 -> 340A). This breaks their odd/even format for VHF/UHF radios and VHF/220 radios (if you consider A being even and B being odd).

53390. Tone not transmitting

Yahoo group: baofeng_uv5r (2015)
Date: 2015-10-19 23:40:43 UTC
From: Dave Allen
Topic: 53390 Message: 53390

Hi all!

I prefer not to use software for programming although that seems to be mostly what you guys talk about.

I should be able to do what I need from the radio's keyboard, but one trick seems to elude me.

A local repeater that I'm trying to programme needs to hear a 123 CTCSS tone. I know that is menu 13, but how do I express the tone frequency? Is it 123, 1230 or what?

Regardless of what that answer is, I can't hear any evidence of the tone in my signal when I listen on another radio, so what am I missing? Is this something else that can only be accomplished through software? I do have software and the cable if that is required, so that's OK. I just want that to be a last resort solution so long as it is avoidable.

73,
Dave

Hi Dave,

You would key in 1230. Then in the display it would read "123.0HZ". Entering 693 would get you "69.3HZ". If you mess up, press 000 to set the menu back to "OFF" so you can start over.

I would also recommend that you take a look at "Buddy's Hints for Eyes Free Operation"
http://buddy.brannan.name/baofeng-uv5r-eyes-free.rtf

Also you might be interested in the "Reference for UV-5R Menus" (also for the BF-F8HP, UV-82 and UV-82HP). Hopefully you can "see" the HTML versions.

From: Dave Allen
Topic: 53390 Message: 53393

Hi Jim!

Thanks for all the info. Buddy's manual is particularly good, but guess I read that explanation with a thick ear, hi hi.

I also got the tone frequency wrong. It's 88.5. I keyed 885 into the menu, but again, when I listened on another receiver, can't detect any tone being transmitted.

I understand the non-standard keyboard, so there's no issue with that.

73,
Dave

53394. Re: [baofeng_uv5r] Tone not transmitting

Yahoo group: baofeng_uv5r (2015)
Date: 2015-10-20 00:58:35 UTC
From: Scott, KB3JQQ
Topic: 53390 Message: 53394

It's a SUB-AUDIBLE tone, it's deviation
is so low, you can't hear it because,° the speaker is too small to reproduce the tone° most radios filter audio below 300 Hz anyway
If you use the TUNE button on your PSR-500,enter the frequency and transmit, the tonebeing used shows on the scanner's display.
From: "'Dave Allen' dave@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

I also got the tone frequency wrong. It's 88.5. I keyed 885 into the menu, but again, when I listened on another receiver, can't detect any tone being transmitted.

53395. Re: [baofeng_uv5r] Tone not transmitting

Yahoo group: baofeng_uv5r (2015)

From: Tom Consodine ND5Y
Topic: 53390 Message: 53395

How are you trying to detect the tone?

Most commercial type radios (including SDR transceiver on a chip based CCRs like Baofeng) have a 300 Hz high pass filter that removes CTCSS and DCS tones from the speaker audio so you can't hear the tones at all. You would need to use the tone search function to detect it, or use something else like a scanner with tone search or test equipment to detect it.

Most Icom, Yaesu, Kenwood and Alinco amateur radios and scanners don't have a 300 Hz high pass audio filter. You can easily hear the higher frequency (above 120 Hz or so) tones if you have a big bassy external speaker or headphones.

Dave,

Are you normally able to hear them? The are considered (and called) sub-audible tones. And my understanding is that most receivers roll of the frequencies below 300 Hz which would make them even harder to hear.

I tried listening to a few of my work channels and was unable to hear the 223.6 Hz CTCSS tone.

Date: 2015-10-20 01:22:26 UTC
From: Dave Allen
Topic: 53390 Message: 53398

Hi all!

So it's the restriction in the radio preventing me hearing it. Ah, the price of progress. I could always detect these so-called sub-audible tones before with my ears, and even knew by monitoring reverse when someone went wrong by setting the wrong tone, but spose it's just showing my age now, hi hi.

May use some sighted help only to confirm the display is reporting correctly, but that's probably all that's good for.

73,
Dave

We been trying to get a “connection” inside the technical engineering side of Baofeng and it is almost impossible to get info on the tech details from them. Most likely will need a trip there and a Chinese Wine and Dine business style dinner to get info.

I do know almost all the Chinese sellers are complaining that the low ball prices has hurt them and some are not happy with Baofeng and bad mouth them often.

They feel dirt Cheap radios give the world an impression that all the Chinese products are all cheap- Nationalistic thinking

You had given me a 3409 before but it had some places that I didn't like so I figured I would hold it back. This one looks great so it has been posted. Thanks.

I'm surprised that Baofeng when from 9 to A (3409 -> 340A). This breaks their odd/even format for VHF/UHF radios and VHF/220 radios (if you consider A being even and B being odd).

How are you trying to "detect any tone being transmitted"?

Are you expecting to HEAR some sort of tone?

CTCSS tones are SUBaudible

Subject: RE: [baofeng_uv5r] Tone not transmitting

Hi Jim!

Thanks for all the info. Buddy's manual is particularly good, but guess I read that explanation with a thick ear, hi hi.

I also got the tone frequency wrong. It's 88.5. I keyed 885 into the menu, but again, when I listened on another receiver, can't detect any tone being transmitted.

I understand the non-standard keyboard, so there's no issue with that.

73,
Dave

Subject: Re: [baofeng_uv5r] Tone not transmitting

Hi Dave,

You would key in 1230. Then in the display it would read "123.0HZ".
Entering 693 would get you "69.3HZ". If you mess up, press 000 to set the menu back to "OFF" so you can start over.

I would also recommend that you take a look at "Buddy's Hints for Eyes Free Operation"
http://buddy.brannan.name/baofeng-uv5r-eyes-free.rtf

Also you might be interested in the "Reference for UV-5R Menus" (also for the BF-F8HP, UV-82 and UV-82HP). Hopefully you can "see" the HTML versions.

If the other companies don't want to be seen as cheap junk radios, perhaps they should try to stop building cheap junk radios.

But then again, given what US customers _KNOW_ about Chinese electronic products, there is no way for them to compete other than on price.

Bottom line, no one has been able to identify any Chinese brand of electronics where the Quality CONTROL is acceptable. Therefore US buyers will only buy Chinese tech products under one of two circumstances:
1) The price is low enough to make the item a throw-away if it doesn't work
or
2) The product comes from a source that accepts returns easily and quickly.

TYT and Wouxun's quality control is much better than Baofeng's, but at a higher cost. (You could also make the argument their performance and features are better as well, but that's a discussion for another day).

Due to TYT and Wouxun's higher cost, many buyers ignore the various issues with Baofeng products and then ask for help in trying to "fix" those issues. Many of those buyers are also unaware that many seconds and returns are sold over and over again as new product via the internet, including on well known sites like e-Bay and Amazon.

We had a buyer at our booth this past weekend at a NW Arizona show that brought with him two "new" radios he wanted us to program. His boxes included the Amazon bar code sticker on each box and inside one was the tiny 3"x4" packing slip, so I could see he had the radios less than two weeks.

One radio programmed ok and seemed fine (but we don't bring test equipment to a show where folks think the going price for a 5W two-way dual-band radio should be less than $30), but the other unit's display had multiple issues, including missing LCD lines (the number 4 looked like a number 1 in two places on the 146.940 repeater, so no QC was obviously done on that radio before shipment) and the entire display was way too dark (like the LCD was already burned out).

Of course he will be able to return it to Amazon, but they won't return it to the vendor for repair. In all likelihood it will be eventually be tossed back into inventory and resold again later. (I already had a previous customer discover hand-written notes in English inside various radio boxes detailing what a previous buyer had found wrong, but they were resold by Amazon later again anyway).

TYT and Wouxun's quality control is much better than Baofeng's, but at a higher cost. (You could also make the argument their performance and features are better as well, but that's a discussion for another day).

I can't address the QC at TYT beyond my very limited experience with their battery charger, which I regularly recommend as a replacement for the "identical" BaoFeng unit.

BUT, my experience with Wouxun is that their QC is immaterial -- there isn't much point in have the C if you don't at least start with some Q

Overall, my impression of most Chinese tech products is that they copy a good design, cut enough corners to get the price down (along with using components that often involve IP infringement) enabling them to market a 80-90% copy of a Japanese or US product at $50 of the price (the same strategy that the Japanese used in the '50s and '60s to undercut US and European manufacturers, in the electronics and especially the optical industry).

Wouxun appears to be the exception, in that they apparently copied the marketing materials (overall look and feature list) without bothering to copy the engineering - resulting in a dual band ham radio that was (and IS) a grossly inferior product (their UV920R and UV920P)

But then, there is the iPhone: built in China, IIRC. But then, the iPhone is not priced at UV-5R price points.

I’ve been lucky, I guess.. my UV-5R works just fine, as does my DF-888S.

The iPhone is an example of the kind of work that Chinese factories can do IF someone forces QC on them

Back to the UV-5R, yes, most of them work fine -- because it is an adequate design that uses adequate components -- the problem comes when either some component or the assembly is not quite adequate, because there is no serious check to be sure everything was right before they pack and ship it.

Worse yet, the few radios that do fail to meet the limited checks the factory does end up being sold as "scrap" to companies that turn around and sell them as if they were good.

Hi!

If only Apple applied that same QC standard to their firmware, I wouldn't be able to say that my UV5R devices perform more reliably than an Iphone. Of course no one knows what they don't know, either.

Have one 70 cm machine around town that is eluding me, but I'm hoping with some sighted help today to reveal whatever the trouble is so that I can put it right.

As far as I can tell, neither of my Baofeng devices have ever put a foot wrong, but the Iphone causes more head ache than convenience for me, and considering the difference in price paid, that is inexcusable, with no thanks to Apple.

73,
Dave

They do not send back to China either, they use a local address to dump the defective ones, for Baofeng tech they go to a farm area in the Dakota’s. They never return them or repair them, They basically toss them unless it is an easy issue or strip for parts. To return a $30 radio back to China is more than $30!

I have some items from Amazon sent to me to help out the Chinese sellers, they cannot absorb the return shipping. I check them out or strip for parts. Others that check out ok

go as seconds at swap meets or for spare parts- this is not for Baofeng junk but for mobile units and bulky items.

What I can get out of them I send back to China, this way they do not get stuck with shipping fees, can meet the Amazon seller terms, and maybe get some money back instead of a complete loss.

I get to play with models that I did not have to buy first to see how they are in performance and I can offer used seconds to buyers that are generally trying to get a NEW item at a discount price. A good example is a mobile unit that wholesales at $150 and retails at $225-275. The returned unit they generally want 50% back, so if the item is complete and no problem- a $150 radio the return if I sell it is $75 back. So customers have the ability of getting a $225-275 mobile for $75

Most of the returns so far are NIB, or failed trying to program it. So they returned them. Some never even opened. Only a few items it looked like and idiot tried to take apart or lost items from the box. Those we keep for parts.

Others no doubt try to pass the bad ones back to Amazon to someone else.

Good morning from the mountains of north Georgia,

Just put a BF-F8HP in my Volunteer Firefighter radio arsenal. It programmed perfectly, and seems to be a fine radio for the bucks. It does have an annoying 'click' or 'snap' when it activates to receive. Is that a setting or is it inherent in the makeup of the radio?

From: mcquid@...
Topic: 53415 Message: 53415

Hi everyone, I use my UV5R as a scanner to listen to our local police/fire/rescue channels. It works great for this purpose, however I can't seem to find how to scan more than one channel at the same time, I can only choose police OR fire OR rescue. Is there a way to scan multiple channels at once like the Uniden model does, or are we stuck scanning one at a time with the Baofeng? Thanks!

53416. Re: [baofeng_uv5r] Scanning Multiple Channels At Once

From: Jim Unroe
Topic: 53415 Message: 53416

Look at the keypad. See the button labeled [*SCAN]. Press and hold it until scanning commences and the radio will scan all of the channels that are in the scan list.

The scan list is created when the radio is powered on from the channels that have their scan_add bit enabled. For most radios, the scan_add bit is enabled when a channel is programmed manually. But there are a few recent radios where it is disabled.

The scan_add bit can only be edited using software.

From: brian@...
Topic: 53418 Message: 53418

I just purchased a UV-82HP and have been trying it out in our area. I was on a call this morning and the UV-82HP radio had a hard time getting to our repeater. Dispatch only heard static and clicks. I was about 8 miles from the repeater and could still hear it just fine. I also have a BF-F8HP radio as well. I have been able to use that one in some very remote places. I know that the UV is only 7 watts aout put and the F8HP is 8 watts output.

Should these two radios get about the same range seeing how they are so close to the same wattage?

The difference between 7 watts and 8 watts isn't worth discussing.

Are they programmed the same?

Does the UV-82HP have a defective antenna? Try the one from the BF-F8HP on it.

I am not looking to discus the difference in wattage. The difference is so slight as to the a mute issue. What I am trying to say is that should I get about the same range from the 2 radios?

Why do I get a much better range from the BF-F8HO than from the UV-82HP?

They are programmed the same with the same frequencies. I used the F8HP image as a base to build the 82HP image.

To add to what Jim has already stated, just because you can hear a repeater does not always mean you can work that repeater. Most repeater owners have spent a great deal of time and money to have a gain antenna fairly high (or on a mountain top) along with many more watts of output power than either the BF-F8HP or the UV-82HP. That means their signal can easily be heard a great deal further away than what your 7 (or 8) watts on VHF (it drops to 6 or 5 on UHF) is pushing back towards the repeater.

Really the difference between 5 watts and 8 watts is inconsequential too

Yes, if both radios are programmed correctly, if both radios have no hardware issues, and if you stand in the same spot and merely switch hands between radios, you should get the same basic results. It is, of course, highly possible that the UV-82HP (or the antenna) is defective, but since Amazon will allow you to return almost anything for any reason, you can always exercise that option. Many other Baofeng users do on a daily basis.

Jim's answer pretty much covers it, but I will add one comment about using HTs in general.

Any handheld radio is VERY dependent on exactly where you are and exactly how you are holding the radio -- moving, even a few inches, can make all the difference between being successful and not.

USUALLY if you can hear a repeater CLEARLY then you ought to be able to reach that repeater (assuming the radio is properly programmed) - but if the repeater is even a little bit scratchy sounding, try moving a little while listening to see if you can find a better spot. If you know where the repeater itself is located, try facing towards the repeater so that your head is not blocking between your radio's tiny antenna and the repeater. It doesn't take much to block the signal from an HT using a rubber duck antenna.

The difference between 7 watts and 8 watts isn't worth discussing.

Are they programmed the same?

Does the UV-82HP have a defective antenna? Try the one from the BF-F8HP on it.

Nope... it's the radio. Every Baofeng UV-5R series or BF-F8HP has that same "click" you're talking about when the thing activates (or breaks squelch).

It even does it when you have the volume all the way down. Am I correct? And seems like it is even louder on some of the speaker mics available. It's "normal" for that radio. Years ago the FD game me a Kenwood (After I seemed to destroy the three Icoms in two months) that had that same "click" you're talking about whenever the squelch opened up.

I don't know why people think this test is so awesome.
It only did cosmetic damage to the plastic case and antenna.
Probably any hand held radio would still turn on.

That's like damaging a car body with a sledge hammer and then being
totally amazed that you could start the car and drive it.

And I'm not impressed by sprinkling water on it either. Try immersing it in seawater for 24 hours then let it sit for a month until the interior PCB layers corrode and see if it works after that.

Gee, Tom

What do you expect out of a $40 Dollar radio? I for one am impressed. Yea, the AM Noise rejection sucks on the receive, but you have to spend at least $200 Bucks to get better.

Hi Kevin and All

"What do you expect out of a $40 Dollar radio?"

I expect it to work properly and comply with established standards. My BF-F8 HP fails to meet FCC allowable spurious emission standards. Look at Part 97.307(e)

This test does not prove that the Baofeng is or is not a toy, that was never the premise. And even if we suggest that "toy" refers to its inferiority, well the numbers speak for it. It is inferior.

And I say this even though I own 4 UV-5Rs and BF-F8 HPs.

I have a Wouxon KG-UV2D, and a Baofeng UV5R purchased a couple of years ago. The programming cable came with the Wouxon but worked on my WinXP PC for both HTs.

Recently I purchase an HP refurbished PC with Win7, and I upgraded it to Win10. My VIP software was installed but it cannot communicate with my Baofeng even when the old pl-2303 driver is installed. It also will not communicate via Chirp. KG-UV Commander did read my Wouxon but there were no labels and only the receive, transmit, pl tone, and channel name was displayed. Chirp would not communicate with it either.

I tried several suggestions on the Internet to no avail. Anyone have a solution?

OK, let’s do a scientific version of this test. YOU supply 2 Beofeng UV-5R Radios and 2 Icom. ID-51A Radios and send em here. I will supply the Brat, Garden hose, Gasoline, and Non-Contact thermometer.for the flame test.

I will function test all 4 radios. For the “Control” group, I will put one Icom and one Beofeng radio on a Picnic Table in the shade on my deck. All radios will be tuned to the local repeater, 146.610

After the Kids, Flood, and Fire tests, I will have a Shootout between the Beofeng and Icom that were the Control Group. Using both the OEM Duly antennas as well as a 2 Meter J-Pole about 30 Feet in the air, but 200 Feet above Average Terrain, I will try different distant repeaters as well as Simplex between different Hams. Then do long term testing on both radios.

I will post the results here as well as the E-Magazine “The Broadcasters' Desktop Resource” http://www.thebdr.net That I also write for.

Have you tried a CHIRP “Live” CD?? You can down load the Linux version, and burn it to a bootable CDR. That will remove any software, and probably any driver issues.

BTW… sometimes the cable from the HT to the computer is the culprit from a mechanical standpoint. The USB connection is usually just fine, but I have had situations where I have to press the HT end of the cable firmly, and -hold- it while trying to upload/download from the rig.

Kevin.

If you're still in wonderment.....why don't you step up and supply all the sampes?

PS: With a BSEE and MSEE degrees in engineering, both from a top 10 schools, I would love to see your youtube videos.

PS: Sad, but true.....most of todays, so called amateur radio folks, just memorize the questions in the published license pool and think they know what they are talking about. When they get confused, they will typically deflect the subject to another one (e.g. antennas), that they no little about as well.

Go figure.

Hi Patrick

It's not the radio, it's most probably the driver in the newer Windows version that drive the cable chip set.

Go to the Miklore.com web site and download an older driver. Or better yet buy a genuine cable for only a bit more money.

Hope this helps

Hi all!

When I ordered my most recent UV5R, I told them that was what I wanted, and they sent me one identical to my other without any issue.

Today, I tried to order another because a friend asked me to, and they came back with this question.

I would like to know the frequency of UV-5R that you need is

136-174/400-480mhz ?

or

136-174/400-520mhz ?

I know the difference in UHF range width, but it makes me wonder, are all UV5R units necessarily created equal?

Dave,

This URL will take you to the CHIRP list of UV-5R variants.
http://chirp.danplanet.com/projects/chirp/wiki/Baofeng_UV5R_Variants

The physical difference between 400-480 Mhz and 400-520 MHz radios is just the label. These radios began shipping in early 2013 with the UHF band limits set to 400-480 MHz. Toward the end of 2012 we started seeing them shipping iwtih the UHF band limits set to 400-520 MHz.

The radios with 400-480 Mhz band limits were probably made to a specific country where that was a requirement. There is at least on vendor that is selling radios with the UHF band limits set to 430-450 MHz. If you get a good deal on the radio, it doesn't really matter because the band limits can easily change to the full 400-520 MHz band limits using the Baofeng VIP or CHIRP (and possibly other) programming software. Even my UV-5R that I received in April of 2012 has been set to 400-520 MHz.

Yes and no.

All recent models have exactly the same hardware

The firmware changes rather frequently -- and the factory deliberately never lists or describes whatever changes are made in the firmware. In most cases, the firmware changes make no difference so far as the user is concerned. But occasionally a firmware change will fix some small (or not so small) bug in the previous firmware or create a new bug, or change how a function works -- for example, the most recent firmware change included changing the default state of the scan bit from SCAN to SKIP, meaning that memory channels programmed from the keypad will not be scanned unless you use programming software to change that individual channel.

ALL UV-5R radios for at least a year have been capable of operating 136-174/400-520MHz and most have been set to that range. Some of the radios have come in packaging that SAYS 136-174/400-480MHz even though the radio is capable of operating beyond that range and generally comes set to cover the full 136-174/400-520MHz range.

The only way to ensure fully identical radios is to obtain a specific matching firmware version number - unfortunately this is not possible with most sellers because there is no way to determine the firmware without connecting a programming cable and reading the radio with Chirp software (the BaoFeng software does not display the firmware version number). It used to be possible to read the firmware number directly from the radio at start up, but they eliminated this ability a few months ago.

Well, I came up with the idea, so i don’t want to take ALL of the credit.

Agreed. Most could not even put together a simple heathkit anymore. Most all of my Ham Radio stuff is Home Brew or Modified Broadcast gear. Just I can’t see a good way to Home Brew an HT. But, you are right, There are so many Extras out there who cannot do even the most simple Mods and repairs of their equipment, or even make a J-Pole.

I'm not sure "most" amateurs fit your description. Certainly some do, and I think a disproportionate number show up here looking for help.

I've helped test and get a couple of hundred new hams into amateur radio over the past 18 to 24 months. Most do not have a solid electronics background, and many are not interested in using the radio in a hobby aspect, but instead are getting their licenses because they have become involved in some other endeavor which exposed them to the use of/for amateur radio (other volunteer work typically). Those people are interested in learning the proper use of equipment, but they are not interested in learning ham radio as a hobby. That's perfectly okay with me. That is part of what makes amateur radio so great, there is something for every body, whether it is technical or operational.

Just because someone isn't interested in why or how radio waves propagate, or how to install or replace a connector or other part, doesn't make them a "bad" ham radio operator. And, just because someone has deep technical skills doesn't make them a "good" ham radio operator.

Hi!

As long as the level of accessibility (speech output) is constant, it will serve our purposes nicely regardless of what version of firmware it is.

The fellow ham I'm helping now isn't a braille user, which is unfortunate given that age has reduced his memory capabilities a little, but I can programme all the local channels he needs to keep him in the local loop. If it is convenient to record the memory assignments on a Dictaphone, he'll have all the support on hand he needs.

73,
Dave

I downloaded it from their website. While I was looking at what it supposedly programs, at the very end, Baofeng was listed. I was surprised to see it there. Since I already have software that works, I really use that than the Relm. BTW, the Relm model I got covers 148-174 hut I used the model number for the one that covers two meters. Close enough and it works.

Ok, now I'm curious. What Relm software programs your Baofeng?

On Thu, Aug 20, 2015 at 4:42 AM, Rjtoegel rjtoegel@gmail.com [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

Definitely. I got a RT Systems cable for one of my HTs in a thrift store for $3. Yep. Talk about a surprise. But it worked flawlessly. Guess they didn't know what they had. Didn't need it (have a programming cable already) but picked it up because of the name and wanted to see how we'll it worked.

My comment was referring to manual programming. I have only one HT that requires a programming cable, no keys. Got a "generic" cable and downloaded the Relm (HT brand) software. Works fine. Even programs the Baofeng.

Just for fun, I talked with RT Systems today to see what (if any) changes I would need to make in order to support Windows 10 "if" I upgrade. Their response? Our radio programming software and cables are fully supported in Windows 10, so no worries.

Again, it originally cost me some money for their product, but from my days using Windows XP, then the nightmare OS called Vista, then into Windows 7, and now into Windows 8.1 - no support or configuration issues programming any radios. It appears that will continue with Windows 10. IMO, I'd say that was money well spent.

Hi!

I definitely like your outlook and share it.

If we have something someone else wants to learn, it doesn’t matter much what the inspiration was.

We can but be improved by the effort along the way.

These radios easily lend themselves to use in a wide area, and if my ham experience contributes to leading them to a different goal, it has paid off in my book.

Had a chat with a guy several months ago who was quite capable of running digital phone systems, but expressed surprise to me that using radio gave reliable communication without wire involvement. I assured him it was all possible, but kept the technical side light because I didn’t want to discourage him in any way. Need to touch base with him again soon and let him know about the UV5R. If he wants worldwide communication without wires, the combination of a license and IRLP will give him that option, and I’m sure the radio will be within his budget because fancy OCR stuff definitely was, hi hi.

I may be an example of what some might call a 'bad" operator.
I use my ham radios almost purely for public service, (escorting and working at checkpoints for bike treks, marathons, volksmarches, ultra marathons, boat races, etc).
That said I also enjoy the technical aspects building and using kits, antenna systems, power supplies, etc. Surface mount items are no big barrier for me as I can still see and, if sober (joke), my hands don't shake to the point that I can't work the tiny stuff.
However I guess I'm "bad" because I have absolutely no interest in DX or contesting and to look at QST magazine it seems that's 95 or more % of what ham radio is ALL about.
Oh well to each his or her own. I enjoy it for what "I" get and can give out of it. Dave J

Subject: RE: [baofeng_uv5r] UV-5R put to an extreme test

Hi! I definitely like your outlook and share it. If we have something someone else wants to learn, it doesn’t matter much what the inspiration was. We can but be improved by the effort along the way. These radios easily lend themselves to use in a wide area, and if my ham experience contributes to leading them to a different goal, it has paid off in my book. Had a chat with a guy several months ago who was quite capable of running digital phone systems, but expressed surprise to me that using radio gave reliable communication without wire involvement. I assured him it was all possible, but kept the technical side light because I didn’t want to discourage him in any way. Need to touch base with him again soon and let him know about the UV5R. If he wants worldwide communication without wires, the combination of a license and IRLP will give him that option, and I’m sure the radio will be within his budget because fancy OCR stuff definitely was, hi hi. 73,Dave

I'm not sure "most" amateurs fit your description. Certainly some do, and I think a disproportionate number show up here looking for help.

I've helped test and get a couple of hundred new hams into amateur radio over the past 18 to 24 months. Most do not have a solid electronics background, and many are not interested in using the radio in a hobby aspect, but instead are getting their licenses because they have become involved in some other endeavor which exposed them to the use of/for amateur radio (other volunteer work typically). Those people are interested in learning the proper use of equipment, but they are not interested in learning ham radio as a hobby. That's perfectly okay with me. That is part of what makes amateur radio so great, there is something for every body, whether it is technical or operational.

Just because someone isn't interested in why or how radio waves propagate, or how to install or replace a connector or other part, doesn't make them a "bad" ham radio operator. And, just because someone has deep technical skills doesn't make them a "good" ham radio operator.

Hi Dave!

No, that lack of interest doesn’t make you bad.

Public service is a fine and very beneficial way to use what you know.

I’d participate in NTS more if not for third party restrictions limitations.

Public service locally is also great fun and expands the network.

Don’t have any desire to have a bird farm, but no one said I had to either because there’s opportunities for that available to any that want it.

Contesting is a bit peculiar to me, or at least the way it has evolved is. I mean you rarely hear much about the radio or even antenna performance, but the important thing is how well the software managed the log, so you can see from that the computer performance is the only thing that makes the contest interesting to the person, but to each his own.

73,

Dave

53465. Help needed to figure out how to change bands in memory mode on a UV5R5

Yahoo group: baofeng_uv5r (2015)
Date: 2015-10-24 00:26:54 UTC
From: Pete Spotts
Topic: 53465 Message: 53465

Hi folks,

I'm new to Baofeng (and the list) and I've hit a wall with my new UV5R5: I can't change bands in a way that will show VHF on A and UHF on B in memory mode. It came with UHF on both.

There is no BAND button, which leaves me wondering if if the band on A or B in memory mode is defined only by programming.

Oddly, the closest I've seen to the radio I have, based on case design, is the UV-F8+. It has no BAND button on the front of the case either, at least based on the image I've seen on Baofeng USA's website. And the 8+ has an inverted LCD screen, where mine is the typical screen for a UV5.

I can used the menu to change band assignments for A and B, but in VFO mode only.

Does anyone have any ideas about how to change bands on this puppy?

With best regards,

Pete

Sure, and that works fine in VFO mode. But when I shift to memory mode, I get UHF frequency readouts on A and B and see no way of shifting A to VHF. Or maybe I'm not thinking about this in the right way.

With best regards,

Pete

Once you program channels, the "mode" is whatever you programmed it for.I have channels with a 440 RCV and a 2M XMIT because I can't hit the440 receiver and I can't hear the 2M side due to intermod.
Use software to program. It makes it much easier.

The latter. There aren't memories factory dedicated to any one band. You have to program each memory location for the frequency (and hence yyou define the band by chosing that frequency) desired.

A and B are not bands. They are just 2 different frequencies that can be shown at the same time. Both share the same set of memories. You can pick and choose uhf/uhf, vhf/vhf or one of each. Why would you want to limit half of your radio?
